LIST OF APPENDICES

EXECUTIVE SUMMARY

Client	North Ayrshire Council
Site	Beach Drive, Irvine
Proposed Development	Residential development with gardens
Project Objectives	▪ To investigate the possible presence of ground contamination associated with the historical uses of the site and any potential associated risks. ▪ To investigate the ground conditions and provide recommendations on foundation and infrastructure design. ▪ To provide recommendations (if any) for additional works/remediation required.
Recorded Ground Conditions	The soils were noted to comprise of MADE GROUND (up to 3.95 m thick; generally, between GL and 1.20 m), underlain by natural raised marine deposits (fine to coarse SAND) to depths > 6.0m. Groundwater was recorded at 3.40 m depth. Therefore, we consider that a pervasive groundwater table exists at approximately 1.50 m AOD.
Assessment of Risks to Human Health, the Water Environment and Vegetation	The shallow soils are considered to pose a risk to human health with exceedances of toxic metal and PAH contaminants. Phytotoxic copper and zinc contaminants were also recorded within the shallow soils. The shallow soils do not pose a significant risk to the water environment.
Assessment of the Built Environment	Recommended concrete (ACEC) Classification is AC-2 with a Design Sulphate Class for the site of DS-2. Following our water supply pipe risk assessment, we conclude that either barrier (PE-AL-PE), wrapped steel and wrapped ductile iron water supply pipes be utilised. Water supply pipes could be laid in standard width trenches, and backfilled with clean, inert material.
Assessment of Ground Gas and Radon	From the site characteristic hazardous gas flow rate, as calculated and based on a worst-case scenario, the ground gas regime was classified as 'Characteristic Situation 2'. As such ground gas preclusion measures are deemed necessary. Radon gas preclusion measures are not required.
Offsite Waste Classification	Should the shallow soils be removed to landfill, HazWasteOnlineTM software classified 21 out of 30 No. shallow soil samples as Non-Hazardous waste, 8 No. samples were classified as Hazardous Waste and 1 No. (refer to Appendix 15). This is due to elevated TPH and metal results recorded within the made ground/natural soils which are noted to be carcinogenic, flammable, toxic for reproduction and ecotoxic.

EXECUTIVE SUMMARY (Contd.)

Remedial Measures	Given that the site has been classified as Characteristic Situation 2 ground gas preclusion measures are deemed necessary, as set out in Table 16, 17 and 18 within the text. Given the presence of toxic and phytotoxic contaminants within the shallow soils, we recommend that an environmental capping layer be placed in any areas of gardens or soft landscaping. This growing medium should be a minimum of 600mm thick, comprising at least 450 mm of clean, inert subsoil and 150 mm clean, inert topsoil.
Soakaways	The results from soakaway testing indicate the soils to have a low to moderate infiltration rate.
CBRs	CBRs within the natural granular soils recorded minimum results of 10%.
Foundation Considerations (Based on existing site levels)	Based on existing site levels below the eastern and western site areas, a foundation bearing horizon of <1.20 m depth can be expected and will provide an allowable bearing capacity of 75 kN/m^2. Below the central site area, a similar bearing horizon was recorded at depths of 2.0 m to 4.0 m. Foundation solutions will therefore vary from shallow spread to trench fill or even vibro-improvement or piling. The exact foundation option will be dependant on final development levels. Finally, it should be noted that the pits recorded unstable side walls within the granular soils when excavated. This will require consideration when finalising foundation designs.
Invasive Plant Species	The legislated species of Japanese Rose and Cotoneaster have been identified within the site.
Mining	Our researches indicated no risk from shallow mining workings, or recorded mine entries.
Buried Structure	A buried structure was present in the central southern site area (conjectured to be a possible fuel tank) however following requests to the Council, no further information on this tank was made available.

1.0 INTRODUCTION

1.1 Commission

1.1.1 Mason Evans Partnership (MEP) were commissioned by Harley Haddow Ltd (The Engineer) on behalf of North Ayrshire Council (The Client), to undertake ground investigation works at a site, named as Beach Drive, Irvine (Drawing No P18/621/SI/R/F/01 and 02).

1.1.2 Mason Evans supervised ground investigations at the captioned site to determine the underlying ground conditions in relation to a proposed residential development at the captioned site (Drawing No P18/621/SI/R/F/03).

1.2 Investigation Proposals

1.2.1 The investigation proposals were outlined in by the Engineer, dated July 2018. The intention of the investigation was to provide information on the following:

- Soil profile beneath the site.
- Chemical contamination conditions.
- Ground gas emissions.
- Geotechnical characteristics of the materials.
- Foundation bearing characteristics.
- Mining constraints.

1.3 Limitations

1.3.1 Our interpretations of the ground conditions are based on the information retrieved from soil bores and trial pits within the site during the recent investigations. While we have carried out interpretation of the ground conditions between the exploratory locations, it should be recognised that soil and groundwater conditions can vary from point to point. As such, ground conditions at variance with those indicated by the exploratory pits/bores may exist in areas not investigated.

1.3.2 It should be recognised that this report is prepared in accordance with current recommended practice and existing legislation. It is written in the context of a proposed residential development with associated areas of hardstanding. Should there be any alternative end-use, it would be prudent to consult us further to ensure the continued pertinence of the recommendations advised.

2.0 SUMMARY OF DESK STUDY INFORMATION

2.1 General

2.1.1 The content of this report is as summarised in the sections below and supported by a Site Walkover Survey undertaken by Mason Evans in February 2019 (Included in Appendix 01).

2.2 The Site

2.2.1 A summary of the existing site conditions is included in the table below:

TABLE 01 - Site Details and Review of Public Records

Site Name	Beach Drive, Irvine
National Grid Ref	230920, 638150
Site Area	Total site area: Approx. 1.89 Ha
Topography	At the time of the walkover, the site was noted to be generally flat lying in the western and eastern site area with man-made landscaped (mounded) areas in the central southern site area. The surface covering was generally noted to be 'Grass' with areas of hard-standing (i.e. car-park, footpath).
Current Usage	The site was currently in use as a car park (eastern site area) and soft landscaping areas across the remainder of the site.
Proposed Use	A new residential development with gardens and associated roads (Drawing No. P18/621/SI/R/F/03).
Surface Water Bodies	The closest surface water feature is the Garnock/Irvine Estuary, located 31 m north of the site. The Garnock/Irvine Estuary would be considered a potential sensitive water in terms of this site. This waterbody is considered to be tidally influenced. SEPAs Water Environment Hub classified the overall quality as 'good' with a water quality of 'High' in 2014 (Appendix 03).
Groundwater	The 'Kilmarnock' groundwater is recorded to underlie the site. SEPAs Water Environment Hub classified the overall quality of the water body as 'poor' and the water quality as 'poor' in 2014 (Appendix 03).
Public Register Information	4 No discharge consents were registered within 250 m of the site, consisting of sewage effluent discharges. A further 3 No discharge consents are recorded within 500 m of the site. There are no groundwater abstraction points within 1000 m of the site. There are 3 No active and inactive Contemporary Trade Directory Entries within 250 m of the site, and a further 9 No entries are noted within 500 m. No fuel stations are present within 500 m of the site. There is 1 No. registered Landfill site within 250 m of the site (220 m NW of the site) named 'Stevenson Works Tip'.
Fuel Tanks	A buried structure was present in the central southern site area (conjectured to be a possible fuel tank) however following requests to the Council, no further information on this tank was made available.
Radon	The site is located within a low probability radon area where less than 1% of properties are considered to be above the action level.
Invasive Plants	An invasive weeds survey was carried out in April 2019. The legislated species of 'Japanese Rose' and 'Cotoneaster' were identified within the southern central site area and the eastern site area (refer to Appendix 05).
Flooding	The site was shown to be within an area which has a moderate likelihood of river water flooding. The site is not noted to be within an area of coastal or surface water flooding (refer to Appendix 03).

2.3 Site History

2.3.1 Information on the site's historical use was obtained through an inspection of available Ordnance Surveys maps dating from 1863 to the present day. A summary of the information is presented in the following table:

TABLE 02 - Summary of History (Ordnance Survey Map Records)

Ordnance Survey Map Edition	The Site	The Surrounding Area
1856 (1:2,500 scale) **1860** (1:10,000 scale)	• The site was noted to consist of unoccupied land	• A lime works was present to the east of the site • Irvine Harbor was present to the north of the site • Buildings were noted to be present to the north of the site • A ship building yard was noted to be present to the north east of the site (~500m) • The area of 'Fullarton' was present to the north east of the site (~1000m) with housing, churches and schools
1857 - 1895 (1:2,500 scale) **1897** (1:10,000 scale)	• The site was noted to consist of unoccupied land	• A chemical works was noted to be present to the south east of the site (including 'Eglinton' and 'Irvine' works • Expansion had taken place in 'Fullarton'
1895 (1:2,500 scale)	• A railway was noted to run through the site (central and southern site area) • Buildings were noted to be present In the northern site area	• No significant changes
1896 (1:2,500 scale)	• No significant changes	• No significant changes
1910 (1:2,500 scale) **1910 - 1911** (1:10,000 scale)	• No significant changes	• A rifle range was noted to be present approx. 700 m to the southeast
1956 (1:2,500 scale)	• Some buildings were noted to have been demolished in the northwestern site area • Spoil was present in the southwestern site area	• No significant changes
1956 - 1980 (1:2,500 scale) **1958** (1:10,000 scale)	• No significant changes	• Works were noted to be disused to the south of the site (one remained to SE of the site) • Sand pits were present to the south/southeast of the site (~500 m) • Fullarton had undergone expansion
1957 - 1964 (1:2,500 scale)	• No significant changes	• No significant changes
1968 (1:10,000 scale)	• No significant changes	• A bottle works was noted to be present to the southeast of the site (~250m) • Irvine industrial estate was present to the southeast • Disused shafts to the south (500m) and southeast (600m) of the site • There was an increase in housing to the east of the site (Fullarton)

TABLE 02 Continued- Summary of History (Ordnance Survey Map Records)

1978 - 1987 (1:2,500 scale) **1984** (1:10,000 scale)	• A footpath was noted to be present in the central site area • A car park was noted to be present in the eastern site area	• Works to the south of the site were no longer present • Works were present to the south and east of the site • A leisure center was noted to be present to the immediate south of the site • 'Beach Park' with a boating pond was present to the south of the site • A timber yard and works was present to the northeast of the site (>500m) • Disused shafts are no longer noted to be present
1992 (1:2,500 scale) **1991** (1:10,000 scale)	• A presumed car park area was noted to be present in the southwestern site area • Two small buildings were noted in the central site area	• No significant changes
1993 (1:2,500 scale)	• No significant changes	• No significant changes
2001 (1:10,000 scale)	• No significant changes	• No significant changes
2019 (1:10,000 scale)	• No significant changes	• The leisure center was no longer noted to be present

2.3.2 As such and based on the information presented within the Phase I Desk Top Study, **we conclude that the site is 'Brownfield' in nature.**

2.3.3 Copies of historical Ordnance Survey maps are included in Appendix 02.

2.4 Published Geological Information

Superficial Deposits

2.4.1 The available published maps recorded the shallow soils to comprise 'Raised Marine Deposits consisting of sand and gravel (Drawing No. P18/621/SI/R/F/04).

2.4.2 Due to the past site usage, it is anticipated that MADE GROUND soils will exist within the site which may be significant in some areas.

2.4.3 Historical borehole records from within the site and the immediate surrounding area would indicate that this made ground extends up to depths of 4.26 m bgl. This was underlain by deposits of SAND and GRAVEL (Raised Marine Deposits) (Appendix 07). A borehole which extends to a depth of 48.27 m bgl encountered boulder clay at depths of 15.18 m bgl.

Solid and Mining Geology

2.4.4 The underlying rock strata were indicated to consist of sedimentary rocks of the Middle Coal Measures, comprising SILTSTONE, SANDSTONE and MUDSTONE with numerous productive coal seams and seatrock (Drawing No. P18/621/SI/R/F/05). The British Geological Survey Map indicates faulting in the surrounding area.

2.4.5 The Geological Survey Map indicates that the Kilmarnock Major Coal outcrops to the northwest of the site and dips to the northwest (i.e. away from the site).

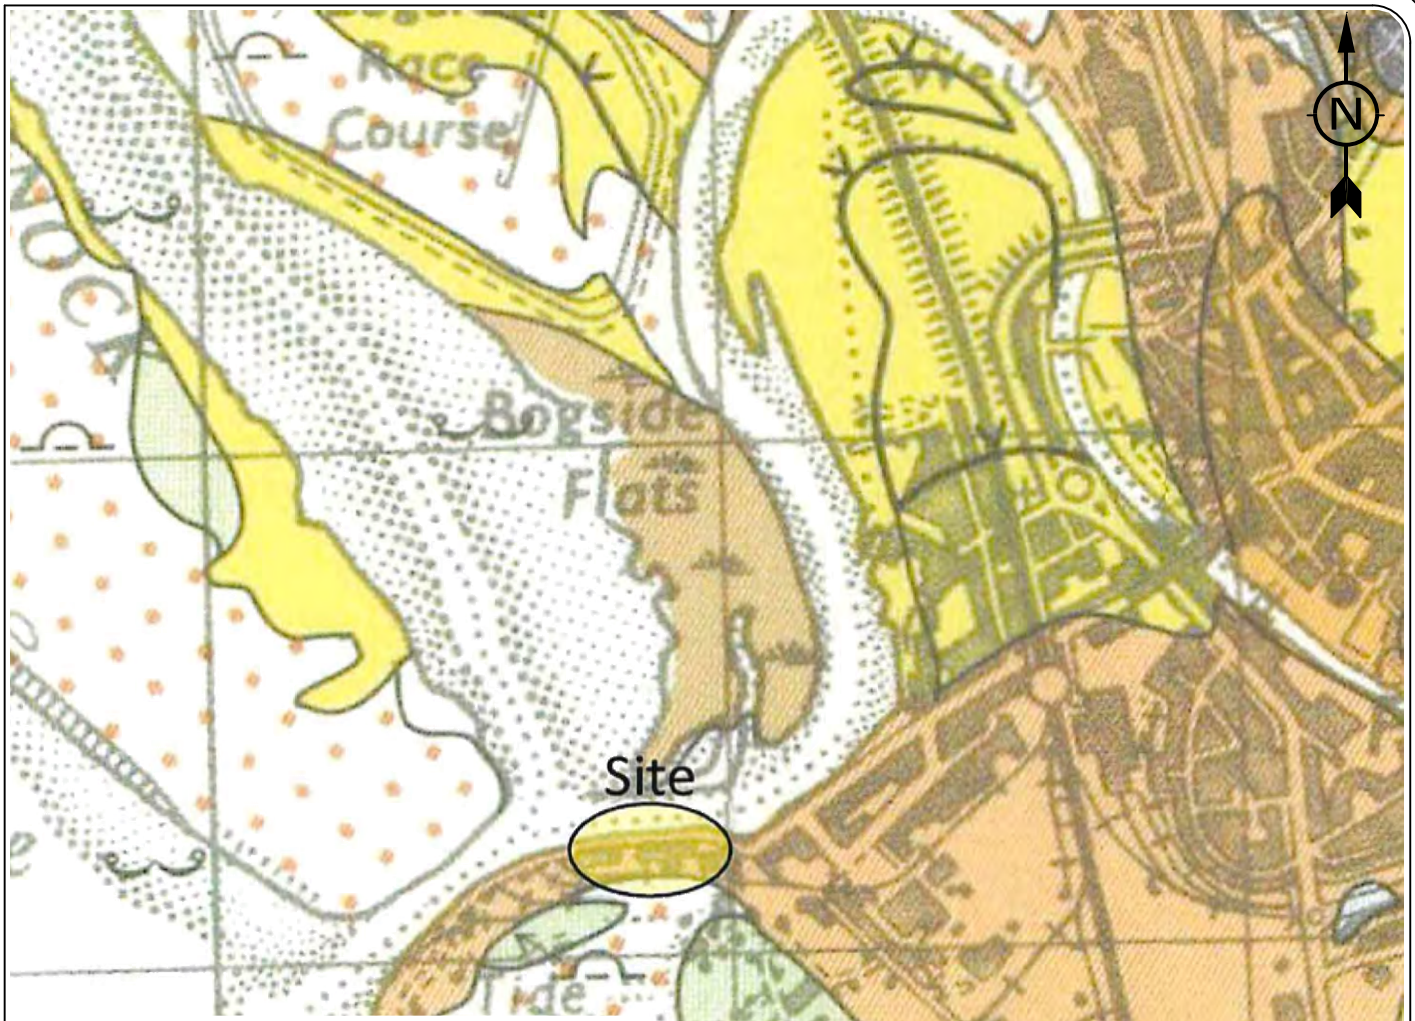
2.4.6 A historical BGS borehole which extends to a depth of 48.27 m bgl encountered rock (described as SANDSTONE) at depths of 31.80 m bgl (Appendix 07).

2.4.7 A review of The Coal Authority Interactive Viewer indicates that the site is located within a 'Coal Mining Reporting Area', however it is not in a 'Development High Risk Area'. A report obtained from The Coal Authority (refer to Appendix 06) states that the 'property is not within a surface area that could be affected by past underground mining'.

2.4.8 Additionally, the Coal Authority Report states that 'there are no known coal mine entries within, or within 20 meters of, the boundary of the property'.

2.4.9 We would therefore consider the site to be minerally stable and not at risk from shallow mining activities.

2.4.10 No historical quarries were noted on the OS maps within the site or surrounding area.



Man-made deposits: waste and natural earth materials
- deposited on original ground surface
- filling former opencast excavation

Landslip

Blown sand: fine-grained, cross-bedded sand containing shell fragments and forming dune and low mounds

Peat: an accumulation of variable thickness of wet, dark brown, partially decomposed vegetation.

Alluvium: silt, sand and gravel deposited in present and former river valleys, often terraced.

Back feature of river terrace: downward slope in direction of arrowhead.

Present beach deposits: mud, silt, sand, shingle and boulders generally within the intertidal zone

Raised Marine Deposits:

Post-Glacial: sand and gravel, often with shell fragments deposited up to 15 m above O. D.

Late-Glacial: mostly sand and gravel with some silt and clay deposited up to 42 m above O.D. in the north decreasing to around 22 m above O.D. in the south

Late-Glacial: marine or estuarine silts and clays of the 'Clyde Beds', where distinguished

Feature marking former coastline: associated with raised beach deposits

Glacial Meltwater Deposits:

Moundy deposits of sand and gravel

Flat or terraced spreads of sand and gravel

Flat or terraced spreads of silt and clay

Hydrogeology

2.4.11 Interpretation of the site hydrogeology required consideration of the general geological conditions. In this instance, the available information indicated the site to be potentially comprised of three geological units: made ground, raised marine deposits and sedimentary bedrock. The typical permeability ranges of each of these strata are recorded in Table 03.

TABLE 03 –Typical Material Permeability

Material	Typical Permeability Range (m/sec)
Made Ground	Variable
Raised Marine Deposits	10^{-1} to 10^{-5}
Sedimentary Bedrock	10^{-6} to 10^{-10}

2.4.12 At present, surface run-off below the site would be moderate over the site given that the eastern site area was surfaced predominantly in hardstanding. Infiltration of surface water would therefore be expected to be moderate.

2.4.13 Given the high permeability of the underlying alluvial soils, it was considered possible that a groundwater body could potentially be present within these deposits. Given the close proximity to the Garnock/Irvine Estuary surface water body, it was considered that this groundwater body would be tidally influenced and would be saline (i.e. groundwater levels may vary).

2.4.14 The potential for a deeper groundwater table within the sedimentary bedrock is moderate given the permeability range of the sedimentary strata. The presence of any potential deep groundwater table would be dependent on secondary porosity, such as fracturing; this would also control any potential movement between shallow and deep lying groundwater bodies.

2.4.15 The Scottish Environmental Protection Agency (SEPA) provides guidance in document WAT-PS-10-01 'Assigning Groundwater Assessment Criteria for Pollutant Inputs' (August 2014) for assessing contamination risks to groundwater and the water environment. As noted above it is considered that a groundwater body could exist within the underlying natural alluvial deposits. As a result, shallow groundwater could be regarded as a potential sensitive receptor.

2.5 Preliminary Conceptual Site Model

2.5.1 In order to fully evaluate the potential presence of contamination at the site, the study area must be considered in an environmental context taking account of its geology, topography, past and present land-use and any previous site investigation data. It is therefore advantageous to develop a 'Conceptual Site Model' as defined in the R & D Publication CLR11 issued by the Department for the Environment and Rural Affairs (DEFRA). The model then forms an integral part of the contamination assessment of the proposed development site.

2.5.2 Statutory guidance sets the definition of contaminated land within the context of the "suitable for use" approach. It is based on the principles of risk assessment, including the concept of a **pollutant linkage** between a **source** contaminant and a **receptor**, by means of a **pathway.** This concept is considered further below. We would highlight that the approach, while perhaps rendering the site suitable for its current use, may provide inappropriate to a change in site designation or specific land use, arising from existing site conditions.

2.5.3 The presence of all three elements identifies a plausible pollutant linkage. An assessment of the potential sources, pathways and receptors constitutes a conceptual mode for the site.

2.6 Source Characterisation

2.6.1 The potential on-site sources of contamination identified by this desk study are:

- Deposition of contaminated materials during historic site development works (railway line and buildings) (construction/use/demolition);
- Usage as a car park (eastern site area).

2.6.2 The potential off-site sources of contamination identified by this desk study are:

- Deposition of contaminated materials from the construction/demolition of neighbouring developments.
- Deposition of contaminated materials from the usage of neighbouring industrial developments.

2.6.3 The typical processes involved, and associated Contaminants of Concern (COC) are discussed and summarised in Table 03 overleaf.

TABLE 03: Contaminants of Concern

THE SITE	Industrial Activity/ Site Use	Potential Pathways	Associated Potential Contaminants
CURRENT	• On-going usage as a car park	• Spillages and leakages of contaminants.	Metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb Organics: Fuel oils, PAH, Phenol Miscellaneous: Asbestos Ground Gasses: CO_2, CH_4
PREVIOUS	• Deposition of contaminated fill materials onto the natural ground below the site. • Railway line	• Deposition of waste materials during construction and usage • Deposition of waste during land reclamation. • Spillage of contaminants.	Metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb Organics: Fuel oils, PAH, Phenol Miscellaneous: Asbestos Ground Gasses: CO_2, CH_4
IMMEDIATE SURROUNDING AREA	**ustrial Activity/ Site Use**	• **Potential Pathways**	**Associated Potential Contaminants**
CURRENT	• Surrounding residential/commercial developments • Demolition of surrounding industrial developments.	• Spillages and leakages of contaminants. • Contaminants transported from surrounding surface run-off.	Metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb Organics: Fuel oils, PAH, Phenol Miscellaneous: Asbestos Ground Gasses: CO_2, CH_4
PREVIOUS	• Surrounding residential/commercial developments • Adjacent 'Chemical Works' • Demolition of surrounding development.	• Deposition of contaminated materials/wastes during construction /demolition. • Spillage of and leakages of contaminants. • Contaminants transported from surrounding surface run-off.	Metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb Organics: Fuel oils, PAH, Phenol Miscellaneous: Asbestos Ground Gasses: CO_2, CH_4

2.7 Receptor Characterisation

2.7.1 Potential receptors at the site are defined on the basis of the site proposal, which will include the development of new residential properties, with associated hard standing and soft landscaping. The following receptors are considered relevant to this site:

- Humans – site end users and construction works (outdoor),
- Humans – site end users (indoor),
- Buildings and services (including water supply pipes and buried concrete),
- Vegetation (plants in soft landscaped areas),
- Water Environment

2.8 Pathway Characterisation (Pollutant Linkages)

2.8.1 The pathways by which sensitive receptors may be exposed to potential sources of contamination, as determined by the proposed end use for the site are as follows:

1. Humans – site end users and construction workers (outdoor)
   - Dermal (skin) contact with contaminated soil, fugitive dust and the absorption of any contaminants through the skin into the body.
   - Inhalation of soil dust or vapour.
   - Ingestion of soil by hand to mouth activity.

2. Humans – site end users (indoor)
   - Inhalation of any ground gas migrating into the buildings.
   - Inhalation of soil derived dust.
   - Ingestion of soil derived dust.

3. Buildings
   - Potential soil gas generated in the ground vertically migrating and pooling within the structure.
   - Contact with aggressive or acidic soils will affect the concrete design of the foundations.

4. Services including the domestic water supply
   - Direct contact with contaminated soil or groundwater.
   - Leaching of contaminants through the soil.
   - Service trenches acting as preferential migration pathways for contamination.
   - Permeation of plastic water supply pipes.

5. Vegetation (plants in landscaped areas)
   - Direct contact with contaminated soils and groundwater.
   - Uptake of contaminants from the soil or groundwater into the plant.
   -

6. Water Environment
   - Leaching of contaminants from the soil to water environment.
   - Contaminant migration offsite in the water environment.
   - Direct entry of contaminants (e.g. spillage) into the water environment.

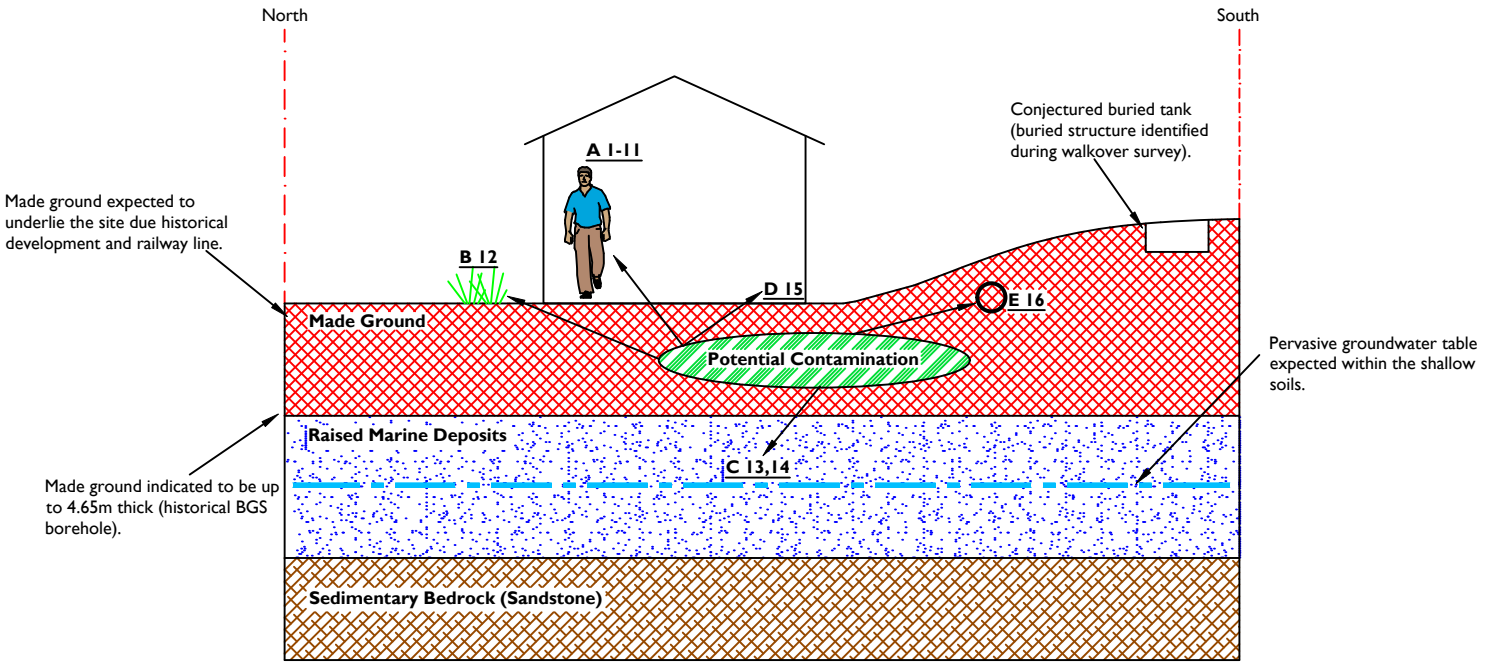
2.8.2 The potential source-receptor-pathway linkages identified for this site are illustrated within our Preliminary Conceptual Site Model (Drawing No P18/430/SI/R/F/06) and on Tables 4A and 4B. Site investigations were required to confirm or otherwise the existence of such linkages in addition to providing further confirmation of the geological and geotechnical conditions.

TABLE 4A: Preliminary Qualitative Risk Assessment – On Site

Source	COCs	Pathway	Receptors (s)	Assessment	Further Investigation Required
1. Areas of potentially contaminated made ground	Metals, semi-metals and non-metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb Organics: Hydrocarbons, PAH, Fuel oil, Phenol Anions: Asbestos, Sulphate Ground gasses: CO_2, CH_4	Dermal contact, ingestion, inhalation	Human – site workers Humans – end users (outdoor)	Spillage/leakage of contaminants impacting near surface soils. Contaminated materials may have been deposited within the site.	Yes
		Leaching through soil or direct migration	The water environment - groundwater	Contaminants may be leached and potentially mobilised from the soil by percolation and/or shallow groundwater movement.	Yes
		Direct contact, leaching through soil, groundwater migration	Buildings and services	Potential for aggressive chemical environments for concrete due to sulphate and acidic conditions. Presence of contaminants in soil that may permeate water supply pipes.	Yes
		Gas/vapour inhalation, vertical/lateral migration	Buildings and services Humans – end users (indoor)	Contamination may include gas/vapour producing materials or compounds that could vertically migrate into overlying buildings producing a potentially asphyxiating or explosive environment.	Yes
		Direct contact, uptake	Plants	Direct contact or uptake of contamination from the soil or groundwater could adversely affect any plants grown.	Yes
		Migration in the groundwater	Groundwater	Contaminants could impact the groundwater and migrate offsite.	Yes
		Point source discharge	Surface water	Garnock/Irvine Estuary	No
		Diffuse source	Surface Water	Garnock/Irvine Estuary	No

TABLE 4B: Preliminary Qualitative Risk Assessment – Off-Site

Source	COCs	Pathway	Receptors (s)	Assessment	Further Investigation Required
1. Areas of potentially contaminated made ground	Metals, semi-metals and non-metals: As, Cd, Cr, Ni, Zn, Cu, Hg, Pb Organics: Hydrocarbons, PAH, Fuel oils, Phenols Anions: Asbestos, Sulphate Ground gasses: CO_2, CH_4	Dermal contact, ingestion, inhalation	Human – site workers Humans – end users (outdoor)	Spillage/leakage of contaminants impacting near surface soils. Contaminated materials may have been deposited within the site.	Yes
		Leaching through soil or direct migration	The water environment - groundwater	Contaminants may be leached and potentially mobilised from the soil by percolation and/or shallow groundwater movement.	Yes
		Direct contact, leaching through soil, groundwater migration	Buildings and services	Potential for aggressive chemical environments for concrete due to sulphate and acidic conditions. Presence of contaminants in soil that may permeate water supply pipes.	Yes
		Gas/vapour inhalation, vertical/lateral migration	Buildings and services Humans – end users (indoor)	Contamination may include gas/vapour producing materials or compounds that could vertically migrate into overlying buildings producing a potentially asphyxiating or explosive environment.	Yes
		Direct contact, uptake	Plants	Direct contact or uptake of contamination from the soil or groundwater could adversely affect any plants grown.	Yes
		Migration in the groundwater	Groundwater	Contaminants could impact the groundwater and migrate offsite.	Yes
		Point source discharge	Surface water	Garnock/Irvine Estuary	No
		Diffuse source	Surface Water	Garnock/Irvine Estuary	NO



Potential Source

· Contaminated made ground.

Potential Exposure Pathways

1. Outdoor ingestion of dust.
2. Indoor ingestion of dust.
3. Consumption of homegrown vegetables.
4. Ingestion of soil attached to vegetables.
5. Skin contact with outdoor soil.
6. Skin contact with indoor dust.
7. Outdoor inhalation of dust.
8. Indoor inhalation of dust.
9. Outdoor inhalation of soil vapour.
10. Indoor inhalation of soil vapour.
11. Inhalation of ground gases.
12. Contaminant uptake by vegetation.
13. Leaching of contaminants to the groundwater.
14. Contaminant migration in the groundwater.
15. Detrimental effects on buried concrete.
16. Permeation of plastic water supply pipes.

Potential Receptors

A. Site users / construction personnel.
B. Vegetation / fauna.
C. Groundwater.
D. Buried concrete (Service and foundations)
E. Plastic water supply pipes.

3.0 SITE INVESTIGATIONS

3.1 General

3.1.1 The scope and location of works was determined by the Engineer. The sampling was non-targeted in relation to geo-environmental matters as dictated by the Preliminary Conceptual Site Model. Site works undertaken were implemented generally in accordance with BS 10175:2011 +A2:2017 and BS 5930:2015.

3.1.2 The following investigation works were undertaken:

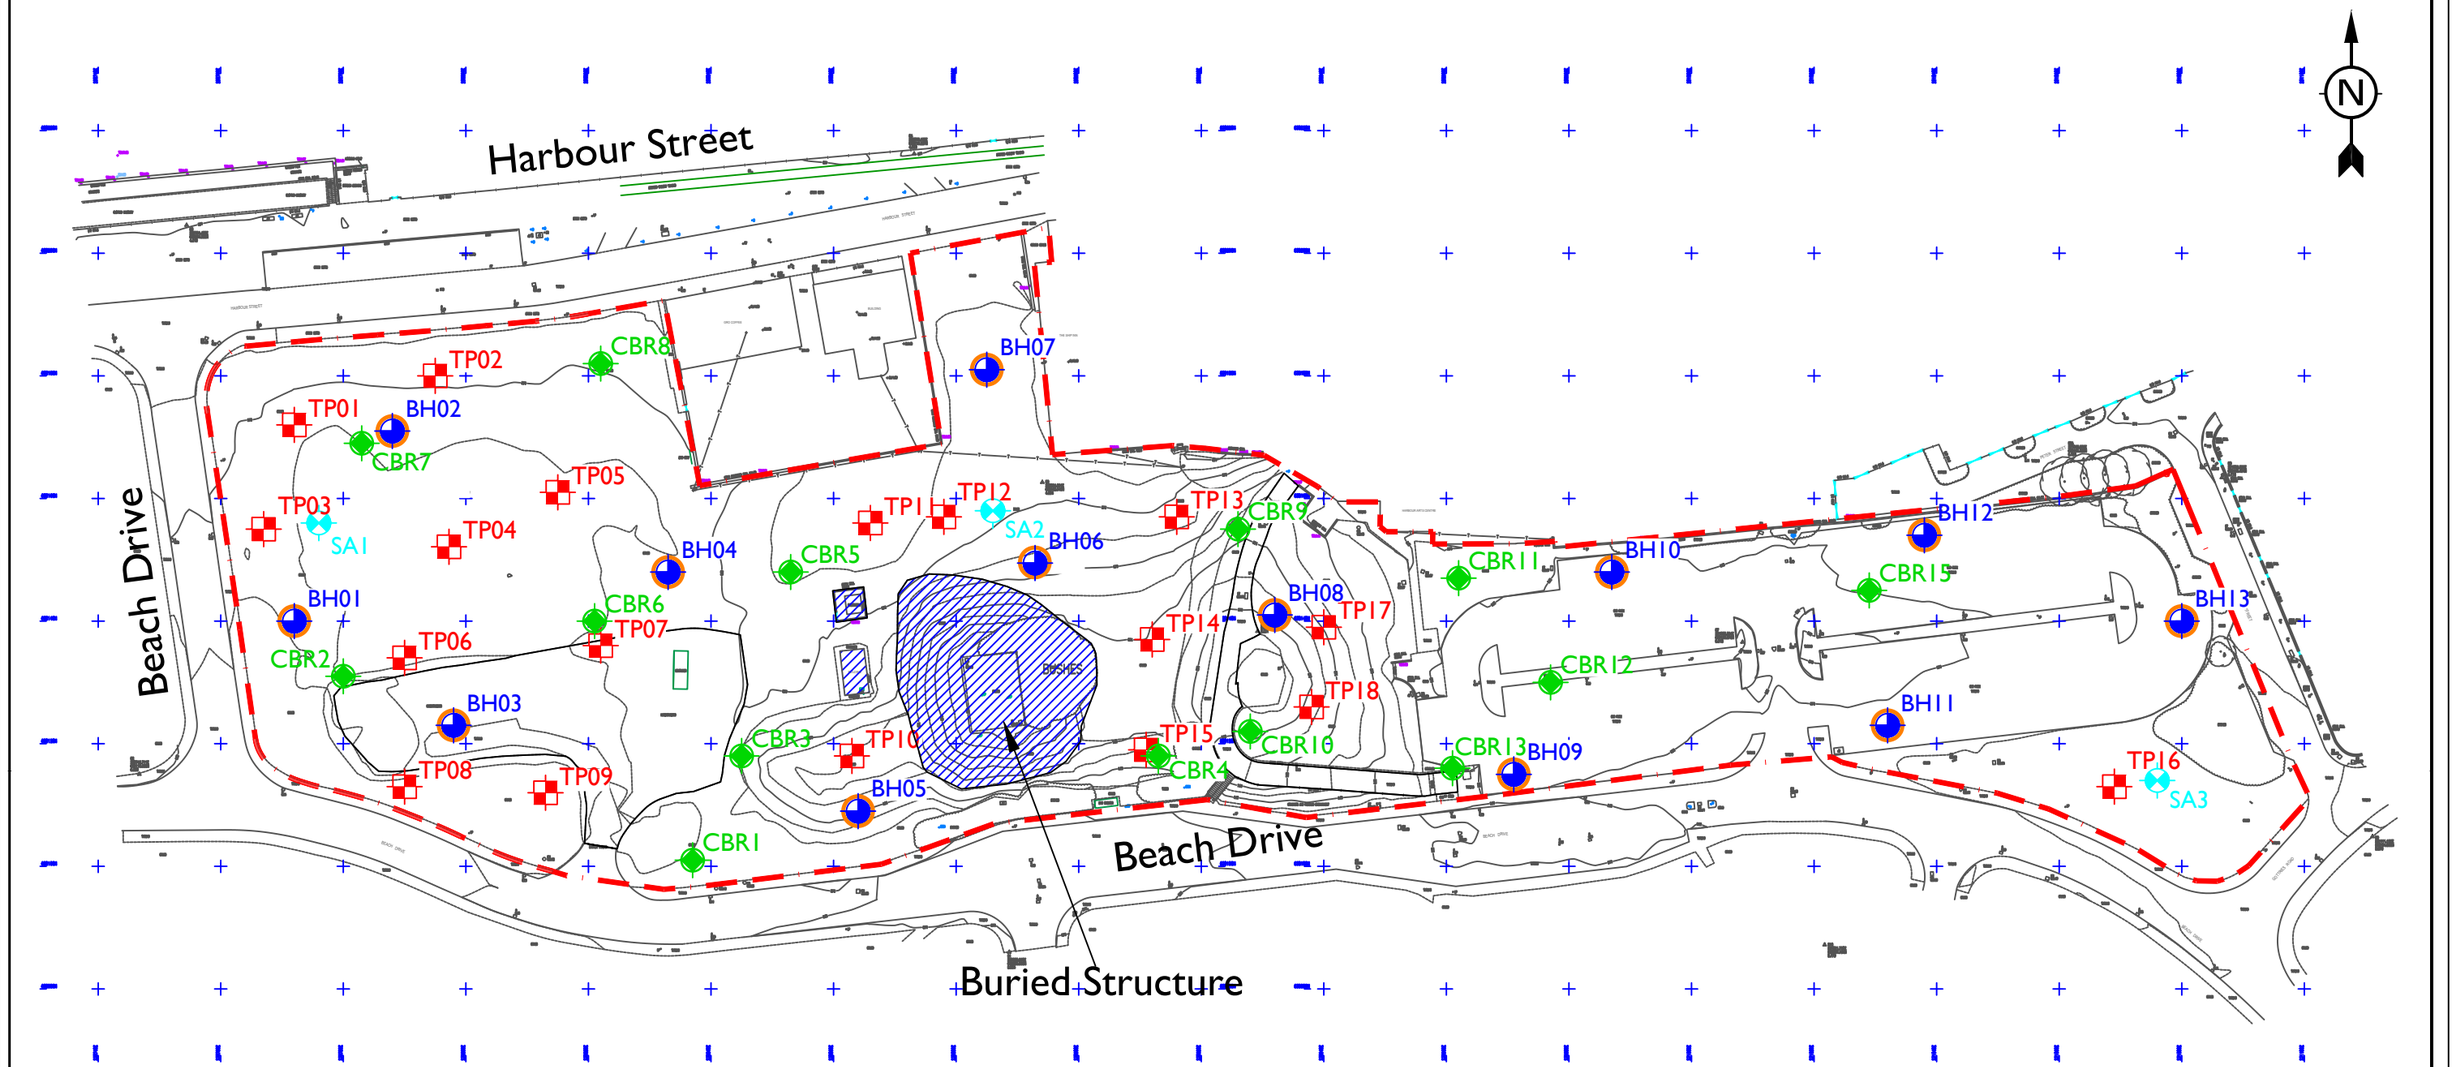
TABLE 05 – Site Investigations

Trial Pits	18 No. trial pits, excavated mechanically, extended to depths of up to 2.90m bgl and logged by an experienced field specialist. Logs are included in Appendix 08.
Soil Boreholes and Well Installations	13 No. soil boreholes were sunk across the site to depths of up to 6.00 m bgl. Gas and groundwater monitoring wells were installed in all 13 No. boreholes. Logs are included in Appendix 09.
California Bearing Ratio Test (CBR test)	15 No. CBR tests were carried out across the site. Logs are included in Appendix 10.
Soakaway Tests	3 No. soakaway tests were carried out across the site. Logs are included in Appendix 11.
Chemical Testing	27 No. soil samples, and 9 No. leachate samples, were tested for a comprehensive range of potential contaminants. Soil chemical analysis results are included in Appendix 12.
Ground Water/Gas Monitoring	4 No. monitoring visits undertaken. Results are included in Appendix 13.
Geotechnical Testing	In-situ SPT tests were undertaken in all boreholes sunk on site. Geotechnical analyses were undertaken on selected soil samples. Results are included in Appendix 15.

3.1.3 The exploratory boreholes were intended to provide geotechnical and hydrogeological data of site areas associated with the proposed development, and to facilitate soil and water sampling for chemical contamination and geotechnical testing, where required.

3.1.4 Representative samples of made ground and underlying natural soils were obtained and tested for an appropriate suite of testing associated with the historical site usage.

3.1.5 Exploratory hole locations are indicated on Drawing No P18/621/SI/R/F/07 and coordinates and levels (mAOD) of each position are included in Appendix 16.



TP01 to TP18	Trial pit supervised by Mason Evans Partnership (February, 2019)
BH01 to BH13	Soils borehole sunk by SKF Ltd (February, 2019)
CBR1 to CBR15	CBR testing undertaken by SKF Ltd (February, 2019)
SA01 and SA03	Soakaway testing undertaken by SKF Ltd (February, 2019)

NOTES

- Site boundary
- Ground gas / water monitoring well installed
- Areas of no access

3.2 Investigation Rationale

3.2.1 Our intrusive investigation has sought to be generally compliant with BS 10175:2001 and BS 5930:2015. We have implemented the following site practices:

- The drilling works have been undertaken by a suitably accredited sub-contractor;
- The geological succession at each exploratory hole location has been logged by an experienced field specialist and samples taken for laboratory analysis together with a visual assessment, made of geological character and potential contaminant impact if present.
- In selecting the appropriate samples for testing, we have taken cognisance of a number of factors, including the proposed site use. Sampling rationale has been determined in accordance with R&D Technical Report P5-066/TR Secondary Model Procedure for the Development of Appropriate Soil Sampling Strategies for Land Contamination, as indicated in the table below.

TABLE 06 – Sampling Strategy

Rationale for Sampling at Different Depths	
Depth Range	**Rationale**
Ground Level – 1.0 m	To assess: • Human/ animal intake arising from ingestion and dermal contact. • Potential for wind entrainment leading to inhalation (of contaminated soils and dusts) or deposition onto neighbouring land. • Surface water run-off (e.g. due to flash flooding). • Uptake by shallow rooting plants (e.g. crops, ornamental and wild species). • Surface leaching to groundwater.
>1.0 m in made or natural ground	To assess: • Intake via ingestion/ inhalation/ dermal contact arising from 'abnormal' (or unpredicted) excavation (e.g. children digging dens) or for other purposes such as swimming pools, ponds, house extensions. • Uptake by deep rooting shrubs or trees. • Intake by or arising from the activities of burrowing animals. • Intake arising from construction/ maintenance of buildings and services, for example: a. Foundations (usually within 2.0 m of final formation level). b. Water supply pipes, telecommunications, gas and power (0.5 m to 1.0 m of final formation levels). c. Sewers (from 0.5 m to >1.0 m of final formation level). • To locate perched water of groundwater. • To confirm depth of made ground. • To locate possible lateral pathways for gas or vapour migration in made ground. • To establish the extent of any leaching of soluble constituents from superficial soils. • To detect 'deep' contamination (e.g. gas generating materials, leachable materials, dense solvents located above an impermeable stratum). • To obtain information on 'background' soil properties. • To locate 'natural' lateral migration pathways.

- The scope of the testing implemented considered the interpreted origin of the materials in association with their description. This is consistent with best practice under current contaminated land guidance. The chemical condition of these materials was assessed for a wide spectrum of potential contaminants, comprising a broad range of common organic and inorganic substances primarily of a toxic or phytotoxic nature.
- During sample collection, relevant information such as notes of field observations has been logged before transferring the samples to laboratory-prepared sample containers of appropriate type. Care was also taken to minimise the aeration of samples during transfer to the containers.

3.2.2 At the generic assessment stage it should be assumed that all pathways, contained within the generic model applied, will be active. In reality, unless a contaminant is volatile (e.g. organic), exposure by direct contact is likely to be mitigated by the depth of the contaminant or available surface cover. Generally, direct contact with contaminants at greater than 600 mm depth, or under hardstanding is highly unlikely to occur, unless the ground is to be disturbed through removal of surfacing or earthworks.

4.0 INVESTIGATION RESULTS

4.1 Ground Conditions

4.1.1 The ground conditions recorded during the investigation were generally consistent with the anticipated sequence of strata indicated by the desk study information. The soils were noted to generally comprise of hardstanding/Topsoil underlain by MADE GROUND, underlain by natural, raised marine (granular) soils.

4.1.2 Rockhead was not encountered within any of the exploratory hole locations, however it is known to exists at depths of between 15.4 m and 22.4 m depth.

4.2 Soils Encountered

4.2.1 A summary of ground conditions encountered is presented in Table 07 below.

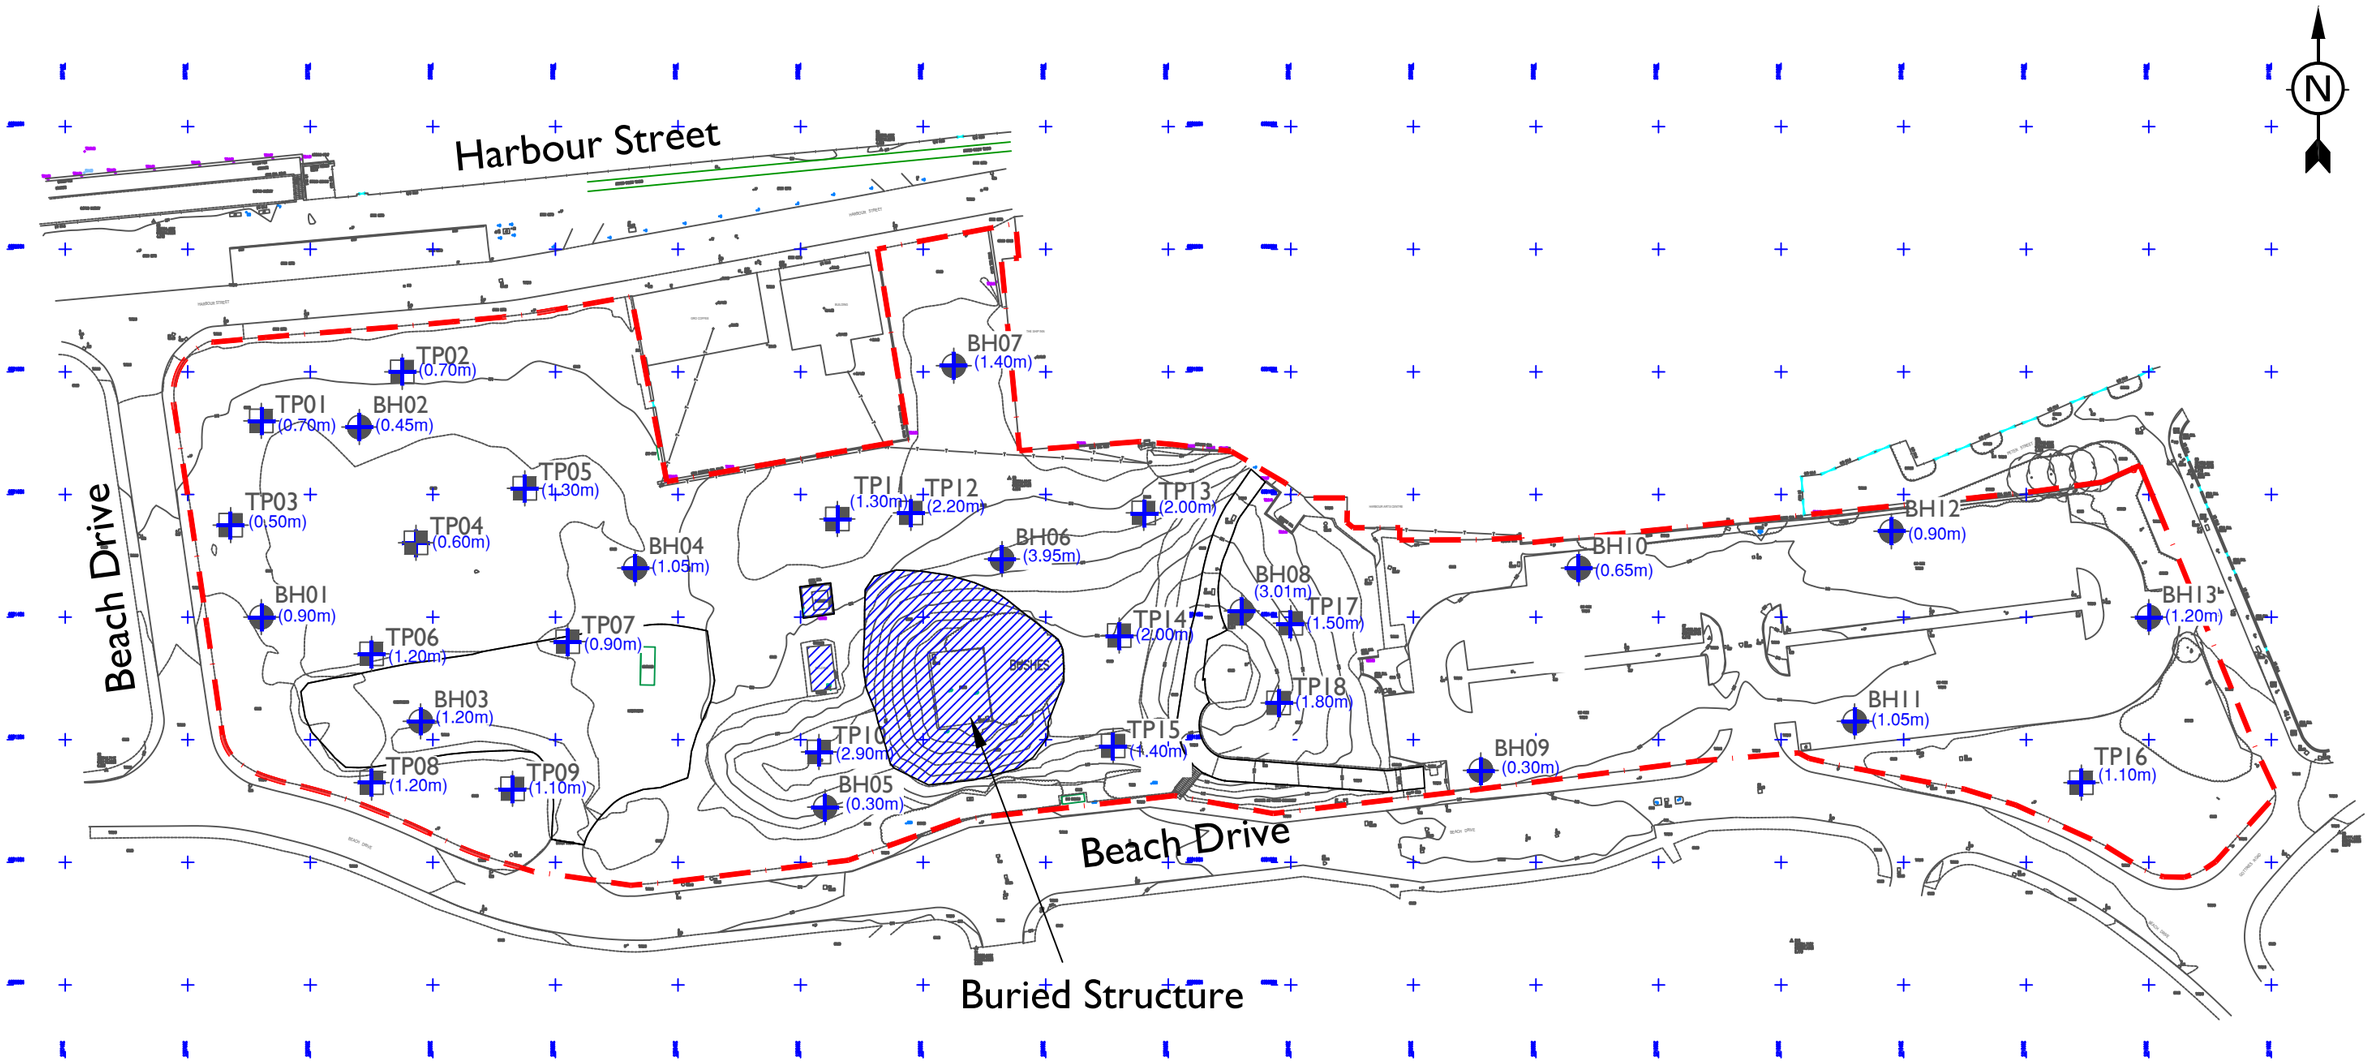
Made Ground

4.2.2 The site was noted to have a surface covering of hard standing of tarmac in the eastern site area (car park) (between 0.07 and 0.10 m thick). Across the remainder of the site, a surface covering of topsoil (made ground), described as brown sandy gravel surfaced in grass, was present and was noted to be between 0.10 m and 0.30 m thick.

4.2.3 This hardstanding/topsoil was further underlain by brown gravelly sand, occasionally described as clayey, with extraneous material of ash, cinders, brick, metal, concrete and plastic. These were encountered below the hardstanding/topsoil and proven up to 3.95 m thick, however they were generally encountered between 0.30 – 1.20 m.

4.2.4 It is considered that the made ground deposits underlying the site are due to historical development within the site. The recorded thickness and distribution of made ground deposits is indicated on Drawing No P18/621/SI/R/F/08.

4.2.5 It should be noted that in the central site area, the site is topographically higher and the soils consisted of TOPSOIL underlain by brown fine to coarse sand. However, it is conjectured that these mounded areas have been formed by earthworks and site re-grading and therefore is considered as made ground.



TP01 to TP18 — Trial pit supervised by Mason Evans Partnership (February, 2019)

BH01 to BH13 — Soils borehole sunk by SKF Ltd (February, 2019)

NOTES

- Site boundary
- (1.20m) Recorded made ground thickness
- Areas of no access

Raised Marine Deposits

4.2.7 Within each of the exploratory hole locations, made ground was noted to be underlain by raised marine deposits. These soils were recorded as light brown/brown fine to coarse SAND (occasionally described as slightly gravelly/silty). The soils were encountered from the base of the made ground and were proven to a depth of 6.0 mbgl.

4.2.8 It should be noted that the upper granular soils become unstable when encountered within the pit excavations.

4.2.9 The recorded depth to medium dense (or better) SAND is indicated on Drawing No. P18/621/SI/R/F/09.

Obstructions

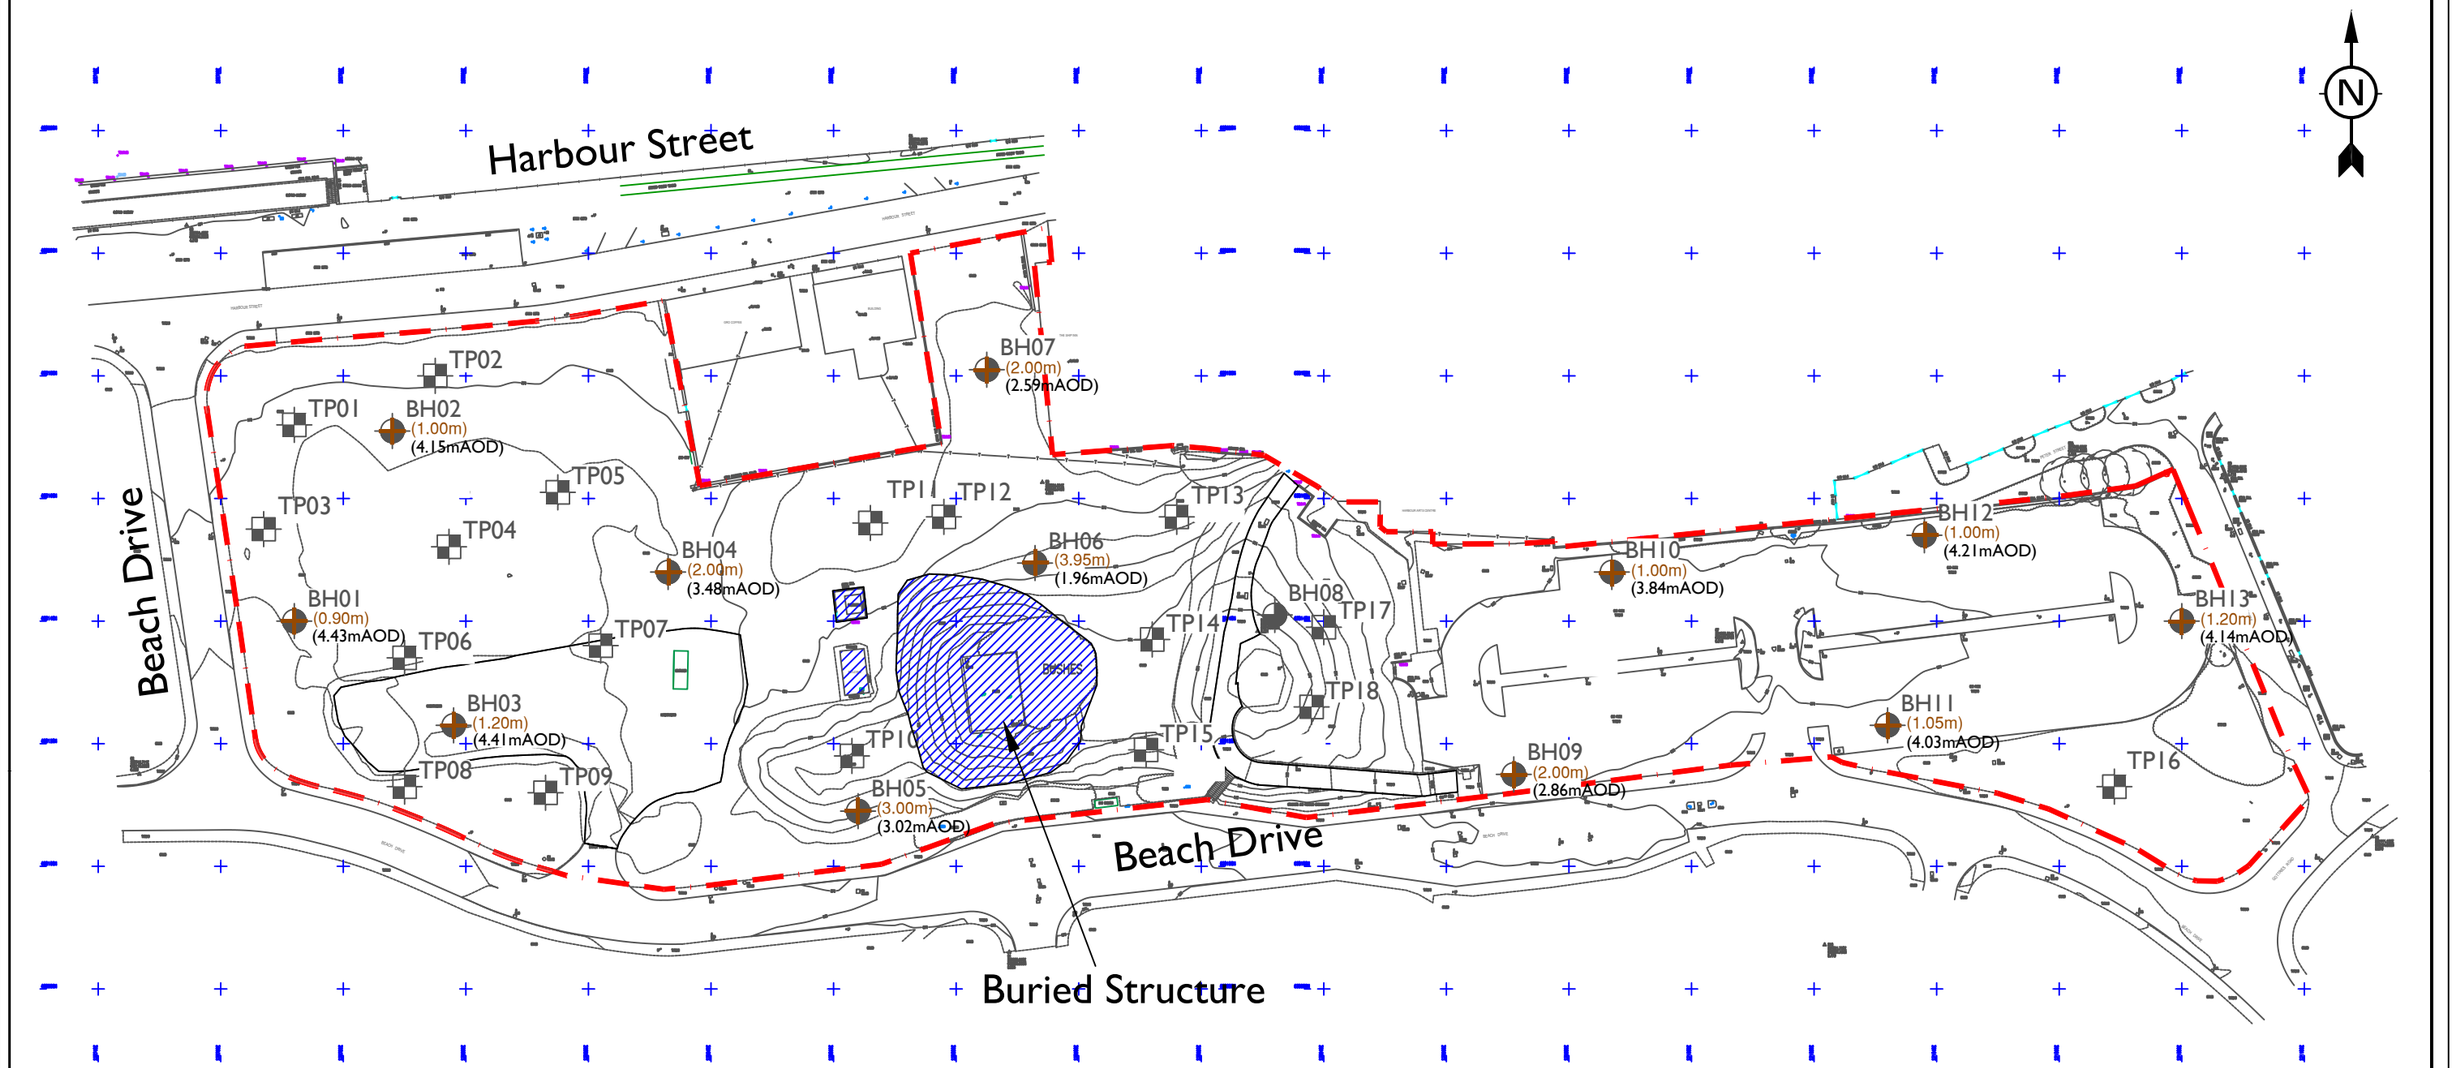
4.2.10 An obstruction was encountered within BH08 at 3.01 m depth described as a hard concrete obstruction. BH12 and BH13 also encountered obstructions at 3.60 m described as 'presumed boulder'.

Buried Structures

4.2.11 In the central southern site area, a buried structure is present with a concrete cover. The council held no information on this structure and therefore for health and safety reasons, we did not investigate this structure.

4.3 Visual/Olfactory Evidence of Chemical Contamination

4.3.1 Generally no obvious visual or olfactory evidence of chemical contamination was observed in the exploratory trial pit or boreholes during site investigation works.



TP01 to TP18 — Trial pit supervised by Mason Evans Partnership (February, 2019)

BH01 to BH13 — Soils borehole sunk by SKF Ltd (February, 2019)

4.4 Groundwater

4.4.1 During site works, groundwater strikes were recorded within 7 No. exploratory borehole locations, at depths between 3.70 m bgl and 5.00 m bgl.

4.4.2 To provide a more accurate assessment of groundwater behaviour, monitoring wells were installed within each of the shallow soil boreholes (13 No). To date, the wells have been monitored on four occasions (results included in Appendix 14). The results of the groundwater depth monitoring are summarised in Table 08 below.

TABLE 07 - Summary of Groundwater Monitoring Results

Location	Depth (m bgl)	Well Depth (m bgl)	Recharge
BH01	DRY	4.00	NO
BH02	DRY	4.00	NO
BH03	DRY	4.00	NO
BH04	DRY	4.00	NO
BH05	DRY	4.00	NO
BH06	DRY	4.00	NO
BH07	3.62	4.00	NO
BH08	DRY	4.00	NO
BH09	3.60	4.00	V. SLOW
BH10	3.63	4.00	NO
BH11	3.65	4.00	NO
BH12	DRY	3.60	NO
BH13	DRY	3.00	NO

4.4.3 A groundwater was recorded at depths of approximately 3.6 (BH07 - BH11) this equates to 1.5 m AOD. Consequently, we consider that a shallow water table exists at this level below the site.

4.4.4 We therefore conjecture that this water table is the 'Kilmarnock Groundwater Body' (refer to section 2.2.1 which has been classified by SEPA as 'poor'.

5.0 CONTAMINATION RISK ASSESSMENT

5.1 Human Health and Groundwater Risk Assessment Screening Criteria

5.1.1 Consideration of analytical results against applicable, conservative risk based screening criteria has been used to provide an assessment of risk. A tiered risk based approach comprises:

- Preliminary Risk Assessment (e.g. establishing potential pollutant linkages);
- Generic Quantitative Risk Assessment (GQRA) (e.g. the comparison of contaminant concentrations against Soil Guideline Values (SGV) or other Generic Assessment Criteria (GAC)); and
- Detailed Quantitative Risk Assessment (DQRA) (e.g. the comparison of contaminant concentrations against site specific assessment criteria).

5.1.2 A GQRA has been carried out as part of this assessment. Soil chemical analysis data has been assessed in terms of risks to human health and vegetation while leachate data has been assessed in terms of risks to the water environment. The GACs utilised are the recently published Suitable 4 Use Levels (S4ULs) derived by LQM/CIEH, based on the exposure parameters, outlined in the DEFRA publication SP1010 (Category 4 Screening Levels (C4SLs) (March 2014). The S4ULs are derived in accordance with current UK legislation, and national policy using the most recent version of the CLEA software (v1.06). Normally the CLEA software utilises the default exposure pathways and land use assumptions outlined in SR3 (Environment Agency 2009b).

5.1.3 The derived S4ULs are based on the concept of minimal tolerable risk as described in SR2 (Environment Agency 2009a) which underpins all previous EA SGVs and other GACs. Please note that S4ULs do not incorporate any toxicological parameter changes to the CLEA base model, however recent toxicological data has been incorporated into the contaminant databases. Furthermore, S4UL GACs are considered to be equivalent to the previously published Environment agency SGVs, and previous iterations of LQM/CIEH GACs and as such are suitable for use in generic quantitative risk assessments under both planning and Part IIa regimes.

5.1.4 In this case we have utilised S4UL values appropriate to a 'residential end-use with gardens'. These guidelines have been used in recognition of the proposed residential development.

5.2 Statistical Analysis of Data

5.2.1 Where appropriate, chemical data for soils can be considered statistically in general accordance with the guidelines given in the Chartered Institute of Environmental Health Publication *Guidance on comparing Soil Contamination Data with a Critical Concentration* (May 2008).

5.2.2 For this project, statistical analysis has not been required.

Sample Depths

5.2.3 At the generic assessment stage, it should be assumed that all pathways contained within the generic model applied will be active. In reality, unless a contaminant is volatile (e.g. organic), exposure by direct contact will likely be mitigated by the depth of the contaminant or available surface cover. Generally, direct contact with contaminants at greater than 600 mm depth or under hardstanding is highly unlikely to occur unless the ground is to be disturbed through removal of surfacing or earthworks.

5.3 Ground Gas Assessment

5.3.1 The potential presence of carbon dioxide and methane at the target site have been appraised in compliance with CIRIA document, *Assessing Risks Posed by Hazardous Gases to Buildings (Report C665)* and BS 8485, *Code of practice for the design of protective measures for methane and carbon dioxide ground gases for new buildings (June 2015)*. These documents detail site investigations methodologies and risk assessment procedures for assessing the results from such investigations.

5.4 Building Materials Assessment

5.4.1 BRE Special Digest 1 'Concrete in Aggressive Ground' (3rd Edition, 2005) has been used to determine an appropriate concrete class for the development.

6.0 HUMAN HEALTH RISK ASSESSMENT

6.1 Contaminants In Soils

6.1.1 27 No. samples of the shallow soils were retrieved from the trial pits and analysed for a range of metal, hydrocarbon and asbestos contaminants. The laboratory test certificates are included in Appendix 13. An overview of the results is shown in Table 08 below.

TABLE 10 - Exceedance of Guideline Levels (Residential End-Use with Gardens)*

* Based on SOM of 2.5 %. Average SOM recorded as 3.8 %
** Phytotoxic values based on pH of >7

6.1.2 We have compared the results with soil guideline values for a residential end land use with gardens, assuming 2.5% soil organic matter. These guidelines have been used in recognition of the proposed residential development.

6.1.3 Toxic metal and polyaromatic hydrocarbons were recorded in the made ground soils.

6.2 Conclusions

6.2.2 As such, it is concluded that the shallow soils underlying the site pose a risk to human health and remedial measures will therefore be required.

7.0 WATER ENVIRONMENT RISK ASSESSMENT

7.1 Water Environment Vulnerability

7.1.1 Based on the desk study researches, interpretation of the ground conditions following investigative works and the results from groundwater monitoring, we consider the main water environment receptor with regards to the site to be the shallow ground water body below the site.

7.1.2 Groundwater was recorded at 3.40 m depth. Therefore, we consider that a pervasive groundwater table exists at approximately 1.50 m AOD.

7.2 Assessment of Water Environment

7.2.1 Following SEPA Position Statement WAT-PS-10-01, *'Assigning Groundwater Assessment Criteria for Pollutant Inputs'* (August 2014), the following assessment should be carried out for potential pollutant linkages to the water environment:

1) Assess which receptors (including surface / coastal waters, wetlands, potable water extractions, and future drinking water potential) may be affected by contamination sources.
2) For potential pollutant linkages, assess contaminant concentrations against relevant screening values at the recommended assessment point, taking into consideration mixing and upstream/upgradient concentrations, where appropriate.
3) Evaluate whether remedial measures would be either disproportionately costly, a risk to other receptors, or cause deterioration of the natural environment.

7.2.2 All water analyses have been compared to appropriate guideline values. Where surface water is considered a primary risk, Environmental Quality Standards are used (EQSs) as obtained from SEPA document WAT-SG-53 (February 2018). Where groundwater is considered the main receptor, Minimum Reporting Values (MRVs) and Resource Protection Values (RPVs) as outlined in SEPA document WAT-PS-10-01 (August 2014) have been used. In the absence of any SEPA published MRV/RPV/EQS we have reverted to the WHO Guidelines for Drinking Water Quality, as amended, (currently 4th Edition, 1st Addendum, 2017) as recommended in SEPA position Statement WAT-PS-10-01.

7.2.3 Based on the recorded ground conditions and the findings from subsequent groundwater monitoring we conclude that a pervasive groundwater body exists within the natural granular soils below the site, at depths ranging of approximately 3.6 m bgl (1.50 m AOD).

7.2.4 In the absence of groundwater samples, 9 No leachate tests were collected and sent for laboratory analysis. The results have been compared to the appropriate guideline values (SEPA's Resource Protection Values (RPV's) and Minimum Reporting Values (MRV's) and in the absence of any SEPA published MRVs and RPVs we have reverted to WHO's Guidelines for Drinking Water Quality (4th Edition, 2011).

7.2.5 The leachate test results are included in Appendix 13 and are summarised in Table 12 overleaf.

TABLE 12 – Soil Leachate Analysis Compared with Appropriate Water Quality Standards

Potential Contaminant	RPV/MRV (µg/l)	WHO (µg/l)	No of Samples Tested (Total)	No of Samples Above Guidelines	Range of Concentrations which Exceeded Relevant Guidelines
Arsenic	10		9	3	TP16 (30) BH11 (22) BH13 (23)
Mercury	0.01		9	1	BH13 (0.35)
Chromium	50		9	0	
Cadmium	0.1		9	0	
Lead	25		9	1	BH13 (51)
Selenium	10		9	0	
Copper		2000	9	0	
Nickel	20		9	0	

7.2.6 The leachate testing has identified exceedances of arsenic, lead and mercury above utilised guideline values.

7.2.7 As leachate analysis was utilised, it is not unexpected that elevations were present. However, these exceedances were localised and marginal and as such we do not consider there to be a risk to the already 'poor' quality groundwater body.

7.2.8 It should also be noted that no groundwater abstraction wells are present within 1000m of the site.

8.0 GROUND GAS EMISSIONS

8.1 General

8.1.1 A ground gas risk assessment has been undertaken to assess the risk associated with carbon dioxide, methane gas and radon, to new buildings and their users. The identified potential sources of ground gas were the thick made ground soils, with timbers, and the tidal alluvial soils underlying the site.

8.1.2 The assessment of risk due to ground gases has been further discussed in publications for CIRIA and BRE, which have indicated a number of 'characteristic situations' depending on the concentrations and flow rates of gas. This classification system has been further developed by Wilson and Card (1999), and Boyle and Witherington (2006) and a revised industry guidance has been provided within CIRIA Report C665 (2007).

8.2 Ground Gas – Results

8.2.1 At the time of reporting, ground gas monitoring of the installations was on-going, having been undertaken at the site on four occasions. The monitoring was undertaken using a portable gas meter and the data is presented below.

8.2.2 Measurements were taken with barometric pressure ranging from 1005 mb to 1028 mb. Oxygen concentrations were recorded to range from 13.8% to 20.4%. Carbon dioxide concentrations were recorded to range from 0.0% and 5.8% vol. Steady state flow rates were not recorded to exceed 0.0 litres/hour over the monitoring period. Methane was not recorded above 0.0 % during any of the monitoring visits. The location of the monitoring wells and a summary of the results are included in Drawing No P18/621/SI/R/F/10. The results of the gas monitoring are included in Appendix 14.

8.3 Ground Gas – Assessment

8.3.1 Gas Screening Values have been calculated in line with CIRIA 665 and BS 8485 (2015) guidance.

8.3.2 This is done by calculating a Q_{hg} for each monitoring point, for each monitoring event. Hazardous gas flow rate Q_{hg} (in lh^{-1}) is calculated using the following:

$$\mathbf{Q_{hg} = C_{hg}/100 \times q}$$

Where:

C_{hg} is the measured hazardous gas concentration (in percentage volume-by-volume)

q is the flow rate (in litres per hour) of combined gasses from the standpipe found by direct measurement.

The Piazza, 95 Morrison Street, Glasgow, G5 8BE

A3 border: 400 X 273

8.3.3 Hazardous gas flow rates were calculated for each monitoring point during each event. A 'worst case' scenario was realised on 20th March 2019, in BH06 where CO_2 was 5.8% and a gas flow rate of 0.0 l/hr was recorded, therefore for the purposes of the report a gas flow rate of 0.1l/hr will be utilised. The resultant hazardous gas flow rate is therefore as follows:

Q_{hg} = 5.8/100 x 0.1
Q_{hg} = 0.0058

8.3.4 The value derived above is the highest possible hazardous gas flow rate calculated over the duration of the gas monitoring. This value corresponds with 'Characteristic Situation 1'. However, as CO_2 was present at levels exceeding 5%, and given the historical land use and thick made ground onsite, we would recommend that the site is upgraded to 'Characteristic Situation 2'.

8.3.5 As such, and based on the above, we consider that the site corresponds to *'Characteristic Situation 2'* where gas preclusion measures are required, as outlined in Table 13.

TABLE 13 – Assessment of Gas Characterisation

Characteristic Situation	Hazard Potential	Gas Screening Value (GSV) (l/hr)	Additional Limiting Factors
1	Very Low	<0.07	Methane not to exceed 1% by volume and carbon dioxide not to exceed 5% by volume.
2	Low	0.07 to <0.7	Borehole air flow not to exceed 70 l/hr, otherwise increase to CS3.
3	Moderate	0.7 to <3.5	None
4	Moderate to High	3.5 to <15	None
5	High	15 to <70	None
6	Very High	>70	None

8.3.6 The construction and use of the building, together with the control of future structural changes to the building and its maintenance (the building's management) should be assessed, since potential risks posed by ground gases are strongly influenced by these factors. The assessment should lead to the categorization of the building as a whole, or each different part of the building, into one of four building types: Type A, Type B, Type C or Type D, as outlined in Table 14.

8.3.7 New buildings should be categorized in accordance with Table 14, as outlined in BS 8485 (2015).

TABLE 14 – Building Types and Descriptions (BS 8485 – 2015)

Building Type	Description
A	**Private ownership with no building management controls on alterations to the internal structure, the use of rooms, the ventilation of rooms or the structural fabric of the building. Some small rooms present. Probably conventional building construction (rather than civil engineering). Examples include private housing and some retail premises.**
B	Private or commercial property with central building management control of any alterations to the building or its uses but limited or no central building management control of the maintenance of the building, including the gas protection measures. Multiple occupancy. Small to medium size rooms with passive ventilation of rooms and other internal spaces throughout ground floor and basement areas. May be conventional building or civil engineering construction. Examples include managed apartments, multiple occupancy offices, some retail premises and parts of some public buildings (such as schools, hospitals, leisure centres) and parts of hotels.
C	Commercial building with central building management control of any alterations to the building or its uses and central building management control of the maintenance of the building, including the gas protection measures. Single occupancy of ground floor and basement areas. Small to large size rooms with active ventilation or good passive ventilation of all rooms and other internal spaces throughout ground floor and basement areas. Probably civil engineering construction. Examples include offices, some retail premises, and parts of some public buildings (such as schools, hospitals, leisure centres and parts of hotels).
D	Industrial style building having large volume internal space(s) that are well ventilated. Corporate ownership with building management controls on alterations to the ground floor and basement areas of the building and on maintenance of ground gas protective measures. Probably civil engineering construction. Examples are retail park sales buildings, factory shop floor areas, warehouses. (Small rooms within these style buildings should be separately categorized as Type B or Type C).

8.3.8 From the identified Characteristic Situation and **taking account of the proposed residential development**, the minimum gas protection score should be calculated, in accordance with Table 15 below.

TABLE 15: Gas Protection Score by Characteristic Situation and Type of Building

Characteristic Situation (CIRIA 149)	MINIMUM GAS PROTECTION SCORE (POINTS)			
	High Risk Type A Building	High Risk Type B Building	Medium Risk Type C Building	Low Risk Type D Building
1	0	0	0	0
2	**3.5**	3.5	2.5	1.5
3	4.5	4	3	2.5
4	6.5	5.5	4.5	3.5
5	-	6.5	5.5	4.5
6	-	-	7.5	6.5

8.3.9 From the site characteristic hazardous gas flow rate as calculated the ground gas regime was classified as 'Characteristic Situation 2'. Taking into account the building type (Type A) this corresponded to a **required solution score of 3.5**, and as such ground gas preclusion measures are deemed necessary.

8.3.10 Following the determination of the minimum gas protection score, a combination of two or more of: 1) structural barrier of the floor slab, and/or; 2) ventilation measures, and/or; 3) a gas resistant membrane should be implemented in order to achieve an adequate score. The protection measures along with relevant scores are outlined in Tables 16, 17 and 18 below.

TABLE 16 – Gas Protection Scores for the Structural Barrier

Floor and Substructure Design	Score
Precast suspended segmented subfloor (i.e. beam and block).	0
Cast in situ ground-bearing floor slab (with only nominal mesh reinforcement).	0.5
Cast in situ monolithic reinforced ground-bearing raft/reinforced cast in situ suspended floor slab with minimal penetrations.	1 or 1.5
Basement floor and walls conforming to BS 8102:2009 Grade 2 Waterproofing.	2
Basement floor and walls conforming to BS 8102:2009 Grade 3 Waterproofing.	2.5

TABLE 17 – Gas Protection Scores for Ventilation Protection Measures

Protection Element / System	Score	Comments
(a) Pressure relief pathway (usually formed of low fines gravel or with a thin geocomposite blanket or strips terminating in a gravel trench external to the building)	0.5	> Whenever possible a pressure relief pathway (as a minimum) should be installed in all gas protection measures systems. >If the layer has a low permeability and/or is not terminated in a venting trench (or similar), then the score is zero.
(b) Passive sub floor dispersal layer: Very good performance: Good performance: Media used to provide the dispersal layer are: Clear void. Polystyrene void former blanket. Geocomposite void former blanket. No-fines gravel layer with gas drains. No-fines gravel layer.	 2.5 1.5	 > The ventilation effectiveness of different media depends on a number of different factors including the transmissivity of the medium, the width of the building, the side ventilation spacing and type and the thickness of the layer.
(c) Active dispersal layer, usually comprising fans with active abstraction (suction) from a subfloor dilution layer, with roof level vents. The dilution layer may comprise a clear void or be formed of geocomposite or polystyrene void formers	1.5 to 2.5	> This system relies on continued serviceability of the pumps, therefore alarm and response systems should be in place. > There should be robust management systems in place to ensure the continued maintenance of the system, including pumps and vents. Active ventilation should always be designed to meet at least "good performance".
(d) Active positive pressurization by the creation of a blanket of external fresh air beneath the building floor slab by pumps supplying air to points across the central footprint of the building into a permeable layer, usually formed of a thin geocomposite blanket.	1.5 to 2.5	> This system relies on continued operation of the pumps, therefore alarm and response systems should be in place. > The score assigned should be based on the efficient "coverage" of the building footprint and the redundancy of the system. Active ventilation should always be designed to meet at least "good performance".
(e) Ventilated car park (floor slab of occupied part of the building under consideration is underlain by a basement or undercroft car park).	4	> Assumes that the car park is vented to deal with car exhaust fumes, designed to Buildings Regulations 2000, Approved Document F[9].

TABLE 18 – Gas Protection Scores for the Gas Resistant Membrane

Protection Element / System	Score	Comments
Gas resistant membrane meeting all of the following criteria: Sufficiently impervious to the gases with a methane gas transmission rate <40.0 ml/day/m2/atm (average) for sheet and joints (tested in accordance with BS ISO 15105-1 manometric method); Sufficiently durable to remain serviceable for the anticipated life of the building and duration of gas emissions; Sufficiently strong to withstand in-service stresses (e.g. settlement if placed below a floor slab); Sufficiently strong to withstand the installation process and following trades until covered (e.g. penetration from steel fibres in fibre reinforced concrete, penetration of reinforcement ties, tearing due to working above it, dropping tools, etc); Capable, after installation, of providing a complete barrier to the entry of the relevant gas; Verified in accordance with CIRIA C735.	2	The performance of membranes is heavily dependent on the quality and design of the installation, resistance to damage after installation and integrity of joints. If a membrane is installed that does not meet all the criteria in column 1 then the score is zero.

8.4 Radon

8.4.1 The Envirocheck report indicated that the site is located within a 'lower probability radon area' and therefore radon gas protective measures are not considered necessary in the construction of new developments.

8.5 Conclusions and Recommendations

8.5.1 From our ground gas risk assessment, the ground gas regime has been classified as Characteristic Situation 2. This has been upgraded from 'Characteristic Situation 1' due to the presence of CO_2 which exceeded 5% and the presence of thick made round along with historical land use.

8.5.2 Taking into account the proposed development type (residential) this corresponds to a required solution score of 3.5, and as such ground gas preclusion measures are deemed necessary, as set out in Table 16, 17 and 18 above.

8.5.3 Additionally radon gas protective measures are not deemed necessary for this site.

9.0 RISKS TO CONSTRUCTED DEVELOPMENT

9.1 Sulphate Attack on Construction Materials

9.1.1 Laboratory testing was undertaken on selected soil samples, at depths from between 0.30 m bgl and 2.00 m bgl, in order to determine the sulphate content and acidity, and hence the concrete class required for buried concrete. The results of chemical tests carried out are summarised in the table below. Full laboratory analysis results are included in Appendix 13.

TABLE 19– Sulphate and pH Summary

Determinant	Range	SDI DS Class	SDI ACEC Class
pH	7.3 – 9.6	DS-2	AC-2
Total Sulphate as SO_4 (%)	<0.010 - 7.8 (Generally, between <0.010 and 0.45)		

9.1.2 In accordance with BRE Special Digest '1:2005 Concrete in Aggressive Ground', recommendations for concrete is 'Aggressive Chemical Environment' for Concrete (ACEC) Classification AC-2 with a design sulphate class for the site of DS-2.

9.1.3 Total Sulphate of 7.8% was detected in one sample from BH06. We would consider this result to be an anomaly and not representative of the site as a whole and may be due to saline groundwater present below the site.

9.2 Phytotoxicity

9.2.1 The proposed development consists of residential housing with gardens. We have interpreted the chemical results to provide comment on the potential for phytotoxic contaminants within the shallow soils.

9.2.2 Guidance on the effects of metal contamination on plant growth is provided within the British Standard 'BS3882:2015 - Specification for Topsoil' and similar guidance issued by the Scottish Agricultural College (SAC) and. A summary of test results versus the recommended phytotoxic screening criteria is provided below:

TABLE 20: Summary of Soil Results vs Phytotoxic Screening Criteria

Contaminant	Screening Value (mg/kg)	Measured Exceedance Concentrations (mg/kg)	Conc > BS 3882 Screening Value
Zinc	300	TP02 (780) TP05 (740) TP05 (920) TP07 (380) TP10 (430) TP11 (310) TP12 (550) TP16 (660) TP04 (390) BH13 (1100) BH09 (340)	YES
Copper	200	TP16 (260) TP16 (280) BH09 (370)	YES
Nickel	110	-	NO

Note – screening value based on average pH >7.0 (Ref BS 3882:2015).

9.2.3 Exceedances of BS 3882:2015 screening values for zinc and copper have been noted within the made ground and natural materials underlying the site. As such, the shallow made ground and natural deposits are considered to pose a potential phytotoxic risk to any future vegetation.

9.3 Water Supply Pipes

9.3.1 UK Water Industry Research (UKWIR) document, '*Guidance for the Selection of Water Supply Pipes to be Laid in Brownfield Sites*', ref 10/WM/03/21, states that on brownfield sites, MDPE/HDPE water supply pipes could be at risk from organic contaminants including mineral oils, VOC's and SVOC's, if the pipes are laid within 15 m of recorded contamination. Additionally, UKWIR states that where metallic pipes are being considered for use, conductivity, pH and redox state of the soil should be assessed to determine if the pipes are at risk of being corroded.

9.3.2 Laboratory UKWIR testing was undertaken, on 3 No soil samples from across the site, for the mandatory parameters outlined in the UKWIR guidance to identify the pipe material most suitable for use within the site. The test results (included in Appendix 12) are summarised in the following tables.

TABLE 21 – UKWIR Test Results

Laboratory Name: Concept Life Sciences		Date: February 2019	Cert No. 19-06308-3, 19-06896-2 & 19-07478-2

9.3.3 The results have concluded that PVC, Barrier (PE-AL-PE) Pipe, Wrapped Steel and Wrapped Ductile Iron water supply pipes could be utilised within the site.

9.3.4 All water supply pipes should be laid in standard width trenches (~0.70 m wide) and backfilled with clean inert material.

10.0 REVISED CONCEPTUAL SITE MODEL

10.1 Contamination Sources/Receptors

Human Health: The shallow made ground deposits underlying the site are considered to pose a risk to human health.

Water Environment: The shallow soils underlying the site are not considered to pose an adverse risk to the water environment.

Ground Gas: Our ground gas risk assessment has indicated that ground gas preclusion measures are deemed necessary, appropriate to '*Characteristic Situation 2*'. Radon gas preclusion measures are not deemed necessary.

Built Environment: Representative samples analysed for pH and sulphate indicate ACEC Classification AC-2 with a design sulphate class for the site of DS-2.

Our water supply pipe risk assessment has indicated that PVC, Barrier (PE-AL-PE) Pipe, Wrapped Steel and Wrapped Ductile Iron water supply pipes could be utilised within the site.

Plant Life: Exceedances of BS3882:2015 screening values for phytotoxic copper and zinc contaminants have been noted.

10.2 Pollutant Linkage Assessment

10.2.1 Based on the environmental investigation results and interpretations, our revised conceptual site model is indicated on Drawing No P18/621/SI/R/F/11.

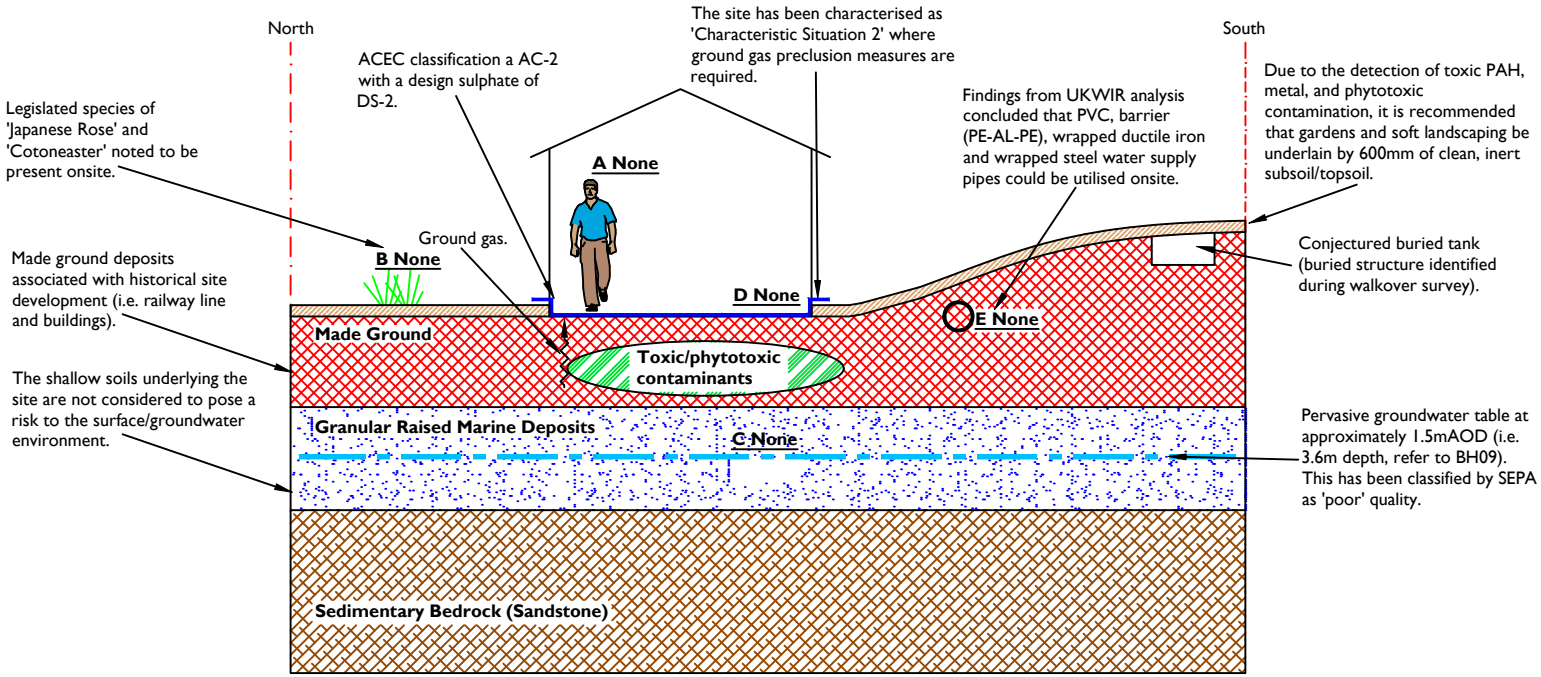
10.3 Mitigation Measures

Human Health and Plant Life

10.3.1 Following the detection of elevated toxic metal/PAH and phytotoxic copper and zinc contaminants, within the shallow soils, we recommend that an environmental capping layer be placed in areas of gardens or soft landscaping. We would recommend a minimum of 600mm thick, comprising at least 450 mm of clean, inert subsoil and 150 mm clean, inert topsoil.

10.3.2 Following our detailed ground gas risk assessment, we conclude that ground gas preclusion measures are required. These measures should be appropriate to 'Characteristic Situation 2', providing a ground gas solution score of at least 3.5. The available protection measures along with relevant scores are outlined in Tables 16, 17 and 18.

10.3.3 Consultation with North Ayrshire Council will be required to finalise the remedial designs.



Source

- Contaminated made ground.
- Ground gas.

Exposure Pathways

1. Outdoor ingestion of dust.
2. Indoor ingestion of dust.
3. Consumption of homegrown vegetables.
4. Ingestion of soil attached to vegetables.
5. Skin contact with outdoor soil.
6. Skin contact with indoor dust.
7. Outdoor inhalation of dust.
8. Indoor inhalation of dust.
9. Outdoor inhalation of soil vapour.
10. Indoor inhalation of soil vapour.
11. Inhalation of ground gases.
12. Contaminant uptake by vegetation.
13. Leaching of contaminants to the groundwater.
14. Contaminant migration in the groundwater.
15. Detrimental effects on buried concrete.
16. Permeation of plastic water supply pipes.

Receptors

A. Site users / construction personnel.
B. Vegetation / fauna.
C. Groundwater.
D. Buried concrete (Service and foundations)
E. Plastic water supply pipes.

The Piazza, 95 Morrison Street, Glasgow, G5 8BE

A4 border: 297 X 210

Buried Infrastructure

10.3.4 Following an assessment of the chemical environment, in terms of concrete classification it has been concluded that due to a potentially aggressive concrete environment, a concrete classification of AC-2, with a design Sulphate of DS-2, will be required for all buried infrastructure.

10.3.5 Given the recorded ground conditions (i.e. thick made ground), and the results from UKWIR analyses, it is concluded that PVC, Barrier (PE-AL-PE) Pipe, Wrapped Steel and Wrapped Ductile Iron water supply pipes could be utilised within the site. All future water supply pipes should be laid in standard width trenches (~0.70 m wide) and backfilled with clean inert material.

Construction/Maintenance Workers

10.3.6 All future site staff should remain vigilant to the possible risk of encountering isolated areas of contaminated material. Should potentially contaminated material be encountered, further testing mat be required to assess the risk to health and safety of the site workers and the environment.

10.3.7 Good site working practices should be followed, including:

- Use of appropriately qualified personnel for the task with the appropriate PPE;
- Provision of on-site washing facilities;
- Maintenance of a high standard of basic hygiene; and
- Implementation of a non-smoking and eating policy within the working area, with designated clean areas set aside for these activities.

10.4 Waste Management Legislation

10.4.1 Should materials be removed and disposed off-site, the developer has a statutory responsibility under the Duty of Care Regulations of the Environmental Protection Act 1990 to ensure that contaminated soil and water is disposed of off-site to a suitably licensed waste management facility in a safe and approved manner.

10.4.2 Should the shallow soils be removed to landfill, HazWasteOnlineTM software classified 21 out of 30 No. shallow soil samples as Non-Hazardous waste, 8 No. samples were classified as Hazardous Waste and 1 No. (refer to Appendix 15). This is due to elevated TPH and metal results recorded within the made ground/natural soils which are noted to be carcinogenic, flammable, toxic for reproduction and ecotoxic.

10.4.3 These results should be passed onto waste contractors for review and consultation. The results are included in Appendix 13 and 15.

10.4.4 In the event that material, uncharacteristic to that which has been previously identified within the site is encountered, we would recommend that a suitably qualified engineer/scientist obtain samples of the suspect material for chemical analysis, thus determining how the material should be managed.

10.5 Contingent Liabilities

10.5.1 Assessments of the site include the determination of contingent liabilities in respect of current and future ownerships subsequent to remedial measures. These consider the impact of the environmental conditions on the study area and surrounding areas on site users, properties and also the liability of the site owners.

10.5.2 With regard to site users, considerations in relation to liability are inherent in the development of a suitable remedial strategy. In the site-specific circumstances presented by the identified conditions, the risk levels suggest minimal liability on ownership due to the environmental conditions, subsequent to development.

10.5.3 The potential for liability arising from site conditions impacting on the surrounding environment largely considers the potential for migration of pollutants beyond the site boundary normally associated with groundwater. Based on the soil analyses, and risk assessment we consider the potential for liability arising from the site conditions to be low.

10.5.4 In the event that more definitive advice is required, we would recommend that the Client seeks specific advice on the liabilities incumbent on ownership from their legal advisors.

11.0 GEOTECHNICAL ASSESSMENT

11.1 General

11.1.1 Geotechnical laboratory testing was undertaken on samples of the natural granular soils. In addition, visual assessment of soils during the sinking of boreholes was supplemented by in-situ standard penetration tests (SPT's). It should be recognised that SPT testing of cohesive soils will only provide an indicative assessment of soils strength, although testing of granular soils will provide more reliable test data.

11.1.2 Geotechnical test results are included in Appendix 15.

11.2 Granular Raised Marine Deposits

11.2.1 Granular raised marine deposits were recorded to underlie the made ground. This granular soil was generally described as being Light brown/brown fine to coarse SAND (occasionally described as slightly gravelly/silty). The recorded distribution and depth of these soils is indicated on Drawing No. P18/621/SI/R/F/09.

11.2.2 Particle size distribution tests were undertaken on the granular soils. The results are summarised in Table 25 below.

TABLE 25 – Summary of Particle Size Distribution Testing

Sample (m bgl)	Fines Content (%) (Clay and Silt)	Sand Content (%)	Gravel Content (%)	Cobble Content (%)
BH01 @ 1.00 – 1.90	4	96	0	0
BH02 @ 2.00 – 3.00	3	93	4	0
BH04 @ 3.00 – 4.00	2	91	7	0
BH05 @ 1.00 – 2.00	3	95	2	0
BH07 @ 2.00 – 3.00	12	82	6	0
BH10 @ 3.00 – 4.00	8	79	13	0
BH11 @2.00 – 3.00	3	81	16	0
BH12 @ 1.00 – 2.00	8	57	35	0

* Where a sedimentation was not undertaken, this figure is representative of total fines i.e. particles of diameter less than 63 microns.

11.2.3 The results are in line with engineers' descriptions with a high percentage of SAND recorded.

11.2.4 SPT tests undertaken within the granular raised marine deposits at depths of between 1.00 and 5.95 m, recorded un-corrected N values of between 1 and >50, generally indicative of 'very loose' to 'dense' soils, supporting the observations made on-site.

Depth	BH01	BH02	BH03	BH04	BH05	BH06	BH07	BH08	BH09	BH10	BH11	BH12	BH13
1.00–1.45	15	7	13	7	4	14	4	34	6	8	22	20	12
2.00-2.45	12	9	16	14	1	14	6	26	11	16	15	2	13
3.00–3.45	14	13	12	11	8	6	11	>50*	9	43	20	14	36
3.60–3.60	-	-	-	-	-	-	-	-	-	-	-	>50*	>50*
4.00-4.45	14	9	39	16	18	12	23	-	11	8	44	-	-
4.50-4.95	48	16	50	28	36	29	22	-	14	18	39	-	-
5.00-5.45	-	-	-	-	28	30	20	-	18	22	35	-	-
5.50-5.95	-	-	-	-	33	29	42	-	18	28	36	-	-

**Obstruction encountered*

N VALUES	CLASSIFICATION
0-4	Very Soft / Very Loose
4-10	Soft / Loose
10-30	Firm / Medium Dense
30-50	Stiff / Dense
>50	Very Stiff / Very Dense

11.3 **CBR Probes**

11.3 **California Bearing Ratio (CBR) Probes**

11.3.1 15 No CBR probes were sunk along the approximate route of the proposed road network (Drawing No P18/621/SI/R/F/03) from ground level to depths of 1.00 m bgl. The location of CBR test probes is indicated on Drawing No P18/621/SI/R/F/06.

11.3.2 A copy of the CBR results is included in Appendix 10 and summarised in Table 26 below.

TABLE 26: Summary of California Bearing Ratio (CBR) Testing

CBR No.	Approx. Depth (m bgl)	Average CBR Value (%)	Comments
CBR01	0.00 – 0.25	12	TOPSOIL
	0.25 – 0.40	25 - 40	Made ground – variable
	0.60	27	Loose granular soils
CBR02	0.00 – 0.25	32	TOPSOIL
	0.25 – 0.80	20 - 50	Made ground – variable
	0.80 – 1.00	35	Medium Dense granular soils
CBR03	0.00 – 0.20	10	TOPSOIL
	0.20 – 1.00	8	Made ground – variable

TABLE 26: Summary of California Bearing Ratio (CBR) Testing Cont…

CBR04	0.00 – 0.20	12	TOPSOIL
	0.20 – 1.00	22 - 30	Granular soils
CBR05	0.00 – 0.20	12	TOPSOIL
	0.20 – 1.00	15 - 25	Made ground – variable
CBR06	0.00 – 0.20	22	TOPSOIL
	0.20 – 1.00	25	Made ground – variable
CBR07	0.00 – 0.10	25	TOPSOIL (Spikes due to Cobble)
	0.26 – 0.40	15	Made ground – variable
	0.40 – 1.00	9	Granular soils
CBR08	0.00 – 0.20	35	TOPSOIL
	0.20 – 1.00	32 - 65	Made ground – variable
CBR09	0.00 – 0.30	20	TOPSOIL
	0.30 – 0.60	11 - 20	Made ground - variable
CBR10	0.00 – 0.10	10	TOPSOIL
	0.10 – 1.00	5	Granular Soils
CBR11	0.00 – 0.20	10	TOPSOIL
	0.20 – 0.80	27 - 50	Made ground - variable
	0.80 – 1.00	35	Granular soils
CBR12	0.00 – 0.30	150	Could not progress due to Density/Cobble
CBR13	0.00 – 0.35	110 - 150	Made ground - variable
	0.35 – 1.00	60 - 80	granular soils
CBR14	0.00 – 1.00	10 - 17	Made ground - variable
CBR15	0.00 – 0.30	125	Could not progress due to Density/Cobble

11.3.3 The results from In-situ CBR testing generally indicate variable CBRs within the MADE GROUND soils and therefore if the MADE GROUND was to be utilised as a bearing horizon for the road then a full 600mm thick capping layer would be required.

11.3.4 The natural granular soils were noted to vary between 5% and 80 % which is in keeping with the visual observations and geotechnical testing which recorded the natural granular deposits to vary between loose and medium dense/dense.

11.3.5 Should the natural granular soils be utilised at the bearing horizon for the road then we would recommend that a 225 mm capping layer be allowed for.

11.4 Soakaway Testing

11.4.1 3 No. Soakaway tests (S01 and S03) were undertaken in the areas of the proposed drainage (refer to Drawing Nos. P18/621/SI/R/F/06)

11.4.2 The underlying ground conditions were recorded to comprise topsoil from existing ground level to a depth of 0.20 m, underlain by MADE GROUND described as a gravelly sand or slightly clayey sandy gravel with extraneous material, encountered between 0.70 m and 1.40 m, further underlain by SAND in two of the three pits (SA01 and SA03).

11.4.3 Groundwater was not encountered within the any of the pits.

11.4.4 The results of the soakaway tests are tabulated in Table 23 below.

Table 27 – Summary of Soakaway Testing

Soakaway Test	Depth of Soakaway Pit (m bgl)	Water Level (m bgl)		Infiltration Rate (m/s)
		Start	Finish	
SA01	1.00	0.20	0.85	0.00002356
SA02	1.40	0.40	0.88	0.00001567
SA03	1.50	1.18	1.44	0.00005642

11.4.5 The results from soakaway testing indicate the soils to have a low to moderate infiltration rate.

11.4.6 A copy of the soakaway test logs and results are included in Appendix 11.

12.0 FOUNDATION RECOMENDATIONS

12.1 Proposed Development

12.1.1 The development proposals for the site include for a residential development with gardens and associated roads, as shown in Drawing No P18/621/SI/R/F/03.

12.2 Foundations

12.2.1 The recorded ground conditions were generally consistent with the anticipated sequence of strata indicated by the desk study information. The soils were noted to generally comprise of MADE GROUND (up to 3.95 m thick; generally, between GL and 1.20 m), underlain by natural raised marine deposits (brown fine to coarse SAND) to depths > 6.0m.

12.2.2 Rockhead was not encountered within any of the exploratory hole locations, however it is known to exists at depths of between 15.4 m and 22.4 m depth.

12.2.3 The site is underlain by a relatively shallow groundwater table at approximately 3.6 m depth i.e. 1.50 m AOD.

12.2.4 An obstruction was encountered within BH08 at 3.01 m depth described as a hard concrete obstruction. BH12 and BH13 also encountered obstructions at 3.60 m described as 'presumed boulder'.

12.2.5 Given the variability of made ground deposits, we would not consider that the thick made ground deposits underlying the site could be utilised as suitable foundation bearing horizon.

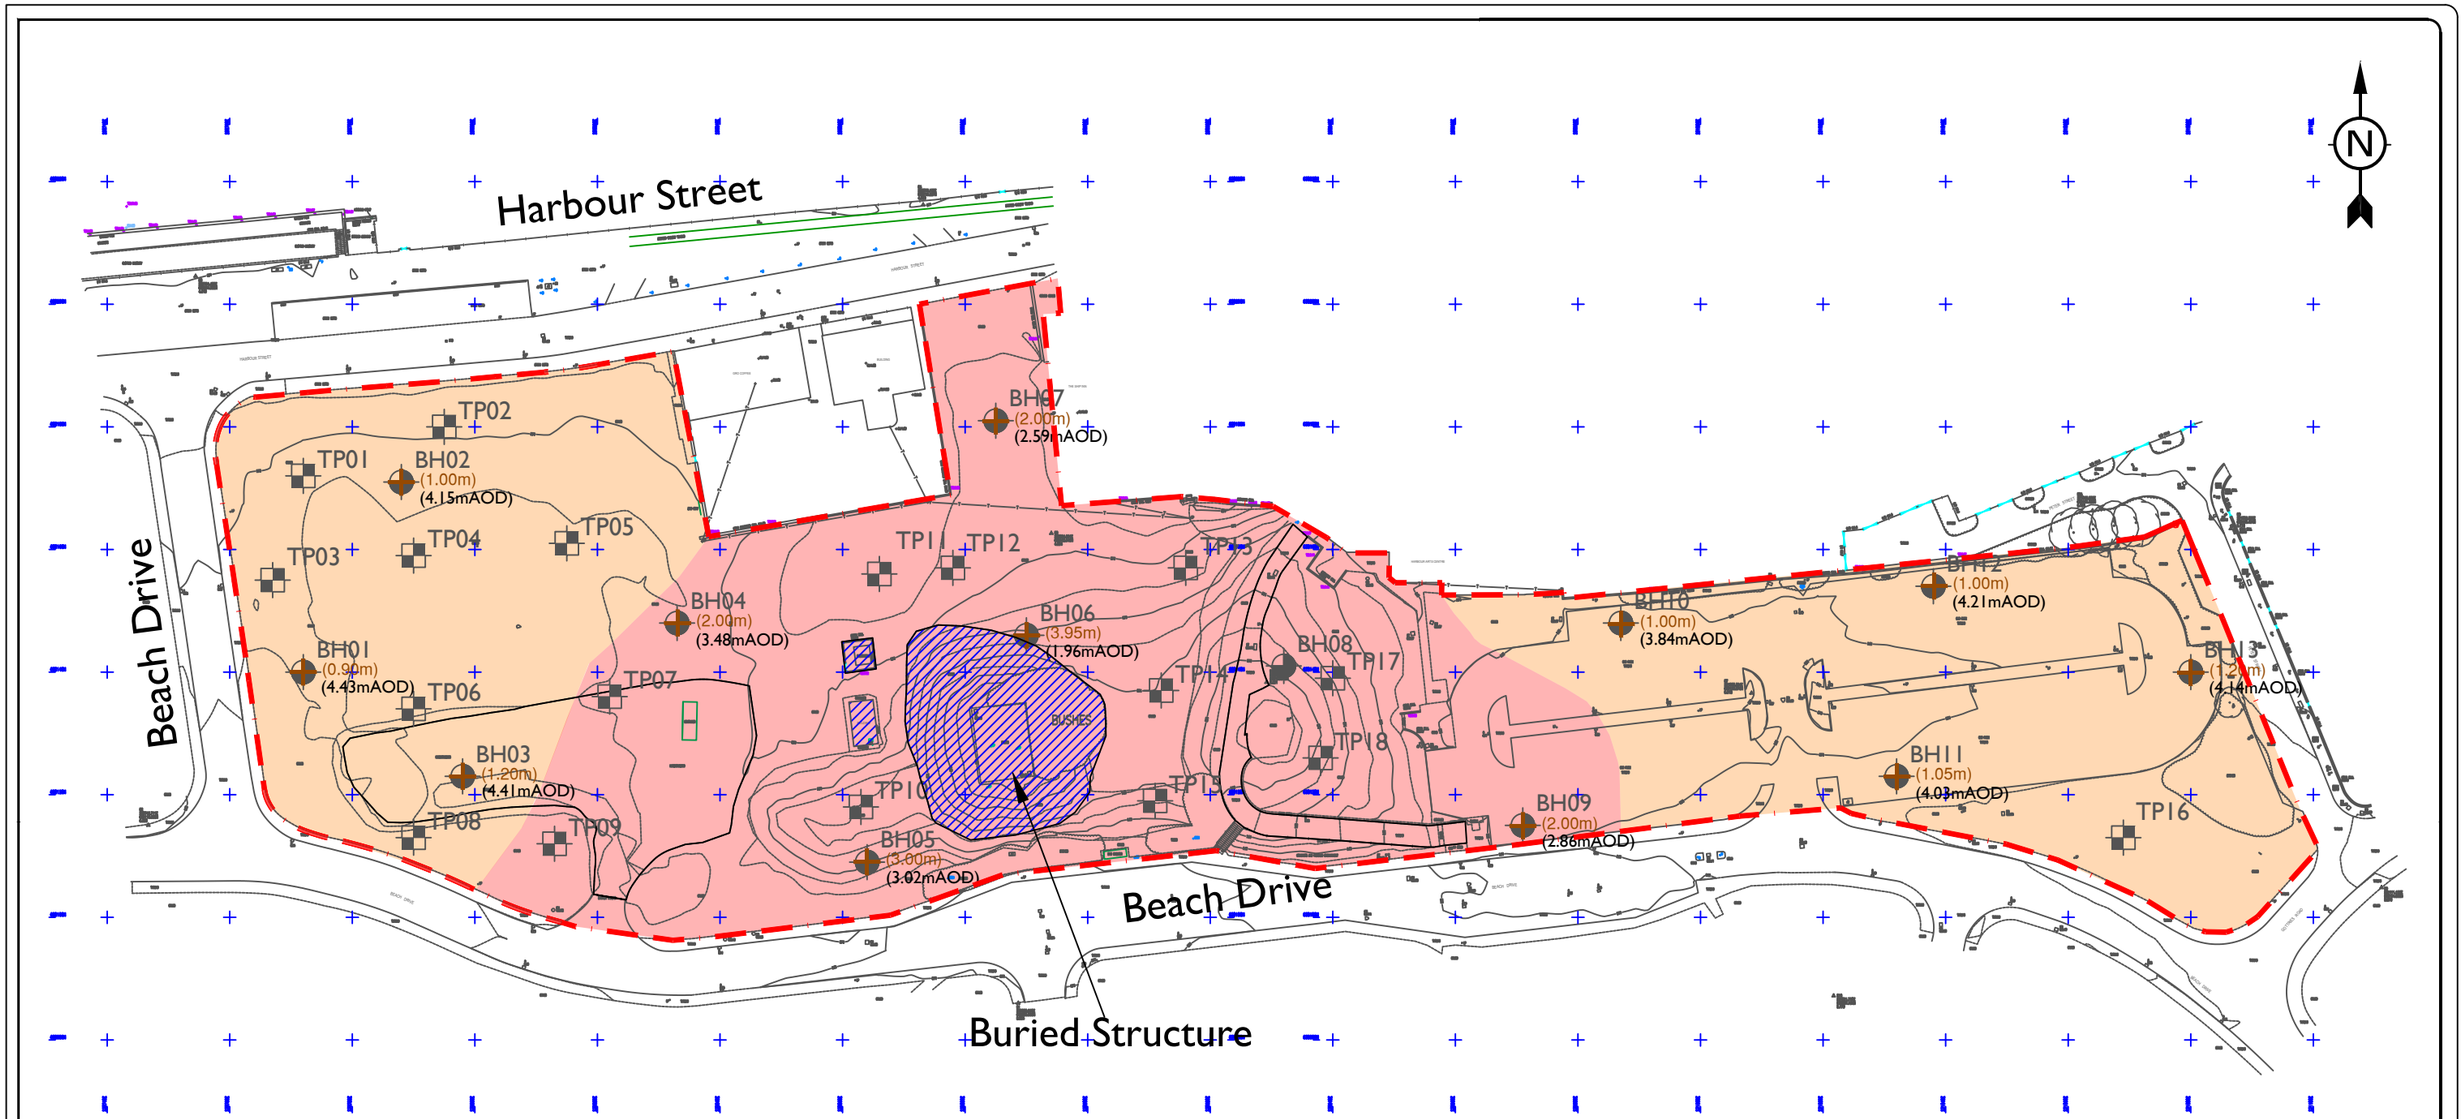
12.2.6 Based on the recorded geology, and confirmed by geotechnical test results, the underlying natural raised marine deposits could be utilised as a foundation bearing horizon.

12.2.7 Depth to a suitable bearing horizon varies across the site. In the eastern and western site areas, the foundation bearing horizon can be expected at <1.0 m below existing site levels with an allowable bearing capacity of 75 kN/m^2 (Drawing No. P18/621/R/F/12).

12.2.8 The central site area is topographically high due to thick made ground and therefore the natural granular soils are at depth. In this area, foundation options include either trench excavations or abnormal options such as vibro-improvement or piling. Please refer to Drawing No. P18/621/R/F/12.

12.2.9 Foundation designs will ultimately depend on final development levels.

12.2.10 Finally, it should be noted that the pits recorded unstable pit side walls within the upper natural granular soils when exposed. This will require consideration when finalising foundation designs.



TP01 to TP18 — Trial pit supervised by Mason Evans Partnership (February, 2019)

BH01 to BH13 — Soils borehole sunk by SKF Ltd (February, 2019)

Depth to foundation bearing horizon (>1.20m below existing site levels) with an allowable bearing capacity of 75kN/m2

Depth to foundation bearing horizon (<1.20m below existing site levels) with an allowable bearing capacity of 75kN/m2

NOTES

- Site boundary
- (1.20m) Recorded depth to medium dense (or better) soils
- (1.20mAOD) Recorded level to medium dense (or better) soils
- Areas of no access

Note:
Topographic survey received from Harley Haddow Ltd (February, 2019)

13.0 CONCLUSIONS AND RECOMMENDATIONS

13.1 General

13.1.1 Intrusive investigations have been undertaken to identify ground related risks that have the potential to impact on the proposed development at the site.

13.1.2 The recorded ground conditions were generally consistent with the anticipated sequence of strata indicated by the desk study information. The soils were noted to generally comprise of made ground (up to 3.95 m thick; generally, between GL and 1.20 m), underlain by natural raised marine deposits (brown fine to coarse SAND) to depths > 6.0m.

13.1.3 Bedrock was not encountered within any of the exploratory hole positions.

13.1.4 Groundwater was recorded at 3.40 m depth. Therefore, we consider that a pervasive groundwater table exists at approximately 1.50 m AOD.

13.2 Chemical Contamination and Gas Emissions

13.2.1 The shallow soils underlying the site are considered to pose a risk to human health with exceedances of metal and PAH contaminants.

13.2.2 Based on chemical analysis of the soils underlying the site, it is considered that they do not pose a risk to the wider water environment.

13.2.3 Phytotoxic copper and zinc contaminants were recorded within the shallow made ground and shallow natural soils. A such we recommend that an environmental capping layer be placed in any gardens and soft landscaping. This capping layer should be a minimum of 600mm thick, comprising at least 450 mm of clean, inert subsoil and 150 mm clean, inert topsoil.

13.2.4 From the site characteristic hazardous gas flow rate, as calculated and based on a worst-case scenario, the ground gas regime was classified as 'Characteristic Situation 2'. As such ground gas preclusion measures are deemed necessary. Radon gas preclusion measures are not deemed necessary.

13.2.5 Should the shallow soils be removed to landfill, HazWasteOnlineTM software classified 21 out of 30 No. shallow soil samples as Non-Hazardous waste, 8 No. samples were classified as Hazardous Waste and 1 No. (refer to Appendix 15). This is due to elevated TPH and metal results recorded within the made ground/natural soils which are noted to be carcinogenic, flammable, toxic for reproduction and ecotoxic. These results should be passed onto waste contractors for review and consultation.

13.3 Invasive Plant Species

13.3.1 The legislated species of Japanese Rose and Cotoneaster have been identified within the site.

13.4 **The Built Environment**

13.4.1 A potential for aggressive chemical conditions is not anticipated within the made ground soils, leading to a recommendation of a concrete ACEC Classification AC-2 with a design sulphate class for the site of DS-2.

13.4.2 Following our water supply pipe risk assessment, we concluded that either barrier (PE-AL-PE), wrapped steel and wrapped ductile iron water supply pipes be allowed for. Water supply pipes should be laid in standard width trenches, and backfilled with clean, inert material.

13.5 **Geotechnical Conclusions and Foundation Recommendations**

13.5.1 Based on existing site levels below the eastern and western site areas, a foundation bearing horizon of <1.20 m depth can be expected and will provide an allowable bearing capacity of 75 kN/m^2.

13.5.2 Below the central site area, a similar bearing horizon was recorded at depths of 2.0 m to 4.0 m.

13.5.3 Foundation solutions will therefore vary from shallow foundations to trench fill or even vibro-improvement or piling. The exact foundation option will be dependent on final development levels. Finally, it should be noted that the pits recorded unstable pit side walls within the granular soils when excavated. This will require consideration when finalising foundation designs.

13.6 **Mining**

13.6.1 Shallow mine workings, recorded mine entries or quarrying activities have not been identified within or in close proximity to the site area. Therefore we conclude that there is a low risk to future developments from shallow mine workings or mine entries.

13.7 **Consultations with Public Authorities**

13.7.1 It should be noted that various local authority departments (North Ayrshire Council) may become involved in the review of the site conditions, including the issues of contaminated land. While measures proposed are consistent with conventional practice we would advise that before design works are advanced to any considerable stage appropriate approvals are received from the relevant Council departments. We would be pleased to liaise with the Council's representatives in this regard.

We trust that this will meet with your current requirements. However, should you require any further information, please do not hesitate to contact us.

Director

Appendix 01

Site Walkover Survey

WALKOVER SURVEY RECORD

Project Name: Beach Drive, Irvine
Project Number: P18-621
Date of Survey: February 2019
Surveyed By: HS
Weather: Sunny and Dry

VICINITY OF THE SITE		DESCRIPTION
Are there any street/house/locality/pub names indicating current or former land use?	N/A	No
What are the neighbouring land uses?	NORTH	Harbour street with River Irvine beyond
	EAST	A road (Beach Drive)
	SOUTH	Beach Drive (road) with Beach Park Beyond
	WEST	Peter Street with residential properties beyond
Potential off-site receptors		River Irvine

ACCESSES

Describe the site accesses - type, width and headroom.		Open access
Describe any access difficulties for SI plant		N/A

SITE DESCRIPTION - GENERAL

What is the current land use?		Unoccupied greenspace in central and western site area and a car park in the eastern site area
What is the topography?		Flat lying to the east and west with topographically high area in the central site area (man-made landscaped area)
What is the surface cover?		Mainly grass with hardstanding in the car park to the east and a small area of hardstanding in the western site area
Are there any waterlogged areas?		None observed
How are the boundaries formed?		Boundaries are open

Does the topography suggest filling or platforming?	YES	Central site area looks to have been upfilled or re-graded
Are there any subsidence features?	NO	

EXISTING BUILDINGS

What proportion of the site do the buildings cover?		~5% – Two small buildings in central site area expected to be associated with services
Do the building(s) show any evidence of distress?	NO	
Indicate nature and location of materials in storage.		N/A
What processes are evident in the facility?		N/A

TANKS AND WASTE STORAGE

Are there any fuel or chemical storage tanks (surface and underground)? For each tank record whether it is above/under ground, nature of contents, whether full or empty, bunded/unbunded/leaking bund, presence of staining. Mark locations on plan.	NO	Possible tank in central site area – concrete slab cover with pipes. Tank most likely buried.
Is there any evidence of waste storage or disposal?	NO	
Are there any chemical drums or other containers?	NO	
Are there any discharges to surface water?	NO	

HYDROLOGY

Describe any groundwater sources - including flow rate.		
Record positions all springs, ponds and other water on site.		

PUBLIC UTILITIES

Are there any overhead cables - indicate type and location?	YES	Central site area – close to buildings
Are there any manholes - describe?	YES	Drainage
Are there other indications of utilities?	NO	
Are there any electricity transformers	NO	Yes – central site area

HAZARDS

Describe any obvious public health hazards.		

SPILLAGES AND CONTAMINATION

Are there any indications of oil or other spillages?	NO	
Is their evidence of contaminated soils?	NO	
Is there evidence of distress to vegetation?	NO	
Describe constituents of any flytipping.		N/A
Is there surface evidence of asbestos contaminated soil?	NO	
Are there any noxious smells?	NO	

GEOLOGY

Soil and rock – record and describe any exposed soils or rocks that are present.		

MINING AND QUARRYING

Are there any signs of mineral extraction in the area, such as old mine buildings, derelict or hummocky land, surface depressions, evidence of infilling or spoil heaps.	NO	
Is their evidence of any quarrying?	NO	

SLOPE STABILITY

Are there any risks of slope instability?	NO	
Is there evidence of previous land slipping?	NO	

INVASIVE PLANTS

Are there any obvious invasive plants?		None observed

Contents

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Report Version v53.0

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1	Yes	Yes	Yes	n/a
Contaminated Land Register Entries and Notices					
Discharge Consents	pg 4		4	3	7
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices					
Integrated Pollution Controls					
Integrated Pollution Prevention And Control					
Local Authority Integrated Pollution Prevention And Control					
Local Authority Pollution Prevention and Controls	pg 7			1	5
Local Authority Pollution Prevention and Control Enforcements					
Nearest Surface Water Feature	pg 8		Yes		
Pollution Incidents to Controlled Waters					
Prosecutions Relating to Authorised Processes					
Registered Radioactive Substances	pg 8				1
River Quality					
Substantiated Pollution Incident Register					
Water Abstractions					
Water Industry Act Referrals					
Groundwater Vulnerability	pg 8	Yes	n/a	n/a	n/a
Drift Deposits			n/a	n/a	n/a
Source Protection Zones					
River Flood Data (Scotland)				n/a	n/a
OS Water Network Lines	pg 8		3	3	19
Waste					
BGS Recorded Landfill Sites					
Integrated Pollution Control Registered Waste Sites					
Licensed Waste Management Facilities (Landfill Boundaries)					
Licensed Waste Management Facilities (Locations)					
Local Authority Landfill Coverage	pg 12	1	n/a	n/a	n/a
Local Authority Recorded Landfill Sites	pg 12	1		1	2
Registered Landfill Sites	pg 13		1		1
Registered Waste Transfer Sites					
Registered Waste Treatment or Disposal Sites					

Summary

Ayrshire

Published 1860

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2001

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Published 1856

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Information Requested and Response

I am compiling desktop information for a site known as Beach Drive, Irvine.

Would North Ayrshire Council have any information pertinent to our investigation such as environmental, mining or historical SI for example? Environmental Health holds two intrusive ground investigation reports by Mason Evans for the area of interest: March 2002 Project No. 2001/153 and January 2006 Project No. 2005/178.

Any information you hold on above ground or underground storage tanks would also be very helpful. Environmental Health holds no information on above ground or underground storage tanks for the area of interest at this time. This information is classified as exempt information under Exception 10(4) (a) of the Environmental Information (Scotland) Regulations 2004 on the basis that this information is not held.ye

I carried out a site walkover last week and noticed a buried structure on the site which my colleague suggested was possibly a hydrocarbon interceptor? Would North Ayrshire Council have any information on this? Environmental Health holds no information on the buried structure noted during your walkover of the area of interest at this time. This information is classified as exempt information under Exception 10(4) (a) of the Environmental Information (Scotland) Regulations 2004 on the basis that this information is not held.

Information about apparatus given on this drawing is indicative only as the original depths and lines of cables and pipes may have been changed by persons unknown. Normally electricity cables are laid in trenches between 450mm and 1m deep, but cellars or structures such as bridges may prevent cables and pipes being laid at these standard depths. Also, the depth may be above or below the standard due to regrading of the surface or other work after the cables are laid. Where known, non-standard depths are indicated. Any interference with, or damage to, ScottishPower apparatus may result in serious accident. Health and Safety Executive booklet HSG47 provides information on the avoidance of danger from underground services. Authorities and contractors will be held liable both for the full cost of repairs to ScottishPower apparatus and all claims made against ScottishPower by Third parties as a result of interference or damage. In the event of an emergency or should you require further assistance contact 0800-092-9290 (ScottishPower area) or 0800-001-5400 (SP Manweb area).

Invasive Plant Survey

Mason Evans Partnership
The Piazza
95 Morrison Street
Glasgow
G5 8BE

18th April 2019

FAO: Heather Scott

Invasive Weeds Survey

Dear Madam,

S2818 – Beach Drive, Irvine

Thank you for your recent enquiry in relation to invasive/legislated weeds. The development area above has been inspected and we are pleased to provide the following report in regard to our findings and recommendations.

Site Description

The survey area is located to the west of Irvin, Ayrshire. The site comprises an undeveloped piece of land, with an area of maintained grassland, a small area of hardstanding and raised hill area which appears to be bunkers to the east and a larger area of tarmac carpark, with shrubs, trees and an area of grassland to the west.

Survey Details

The survey was carried out on 17th April 2019 which is early in the new growing season. At this time of year Japanese Knotweed is identified by any plant material/ vegetation visible at the time of our inspection along with any plant residue such as leaf litter and dead stalks which remains from the previous growing season.

Japanese Knotweed undergoing herbicide management can be more difficult to find and identify, however, identification is still possible if plant crowns or sporadic/bonsai growth are present. We would ask that if the property owner/manager/developer is aware of any treatment programmes; including any infestations historically treated/eradicated and under guarantee, then this information should be disclosed to KleerKut.

This survey was non-intrusive and based on a visual inspection.

Survey Findings – Commonly Known Species Controlled By Legislation

The commonly known plants which we record during our inspections are the following:

- **Japanese Knotweed** *(Fallopia japonica)* **No Evidence**
- **Giant Hogweed** (*Heracleum mantegazzianum*) **No Evidence**
- **Himalayan Balsam** *(Impatiens glandulifera)* **No Evidence**

These plants are on Schedule 9 of the Wildlife & Countryside (Scotland) Act 1981. In Scotland Schedule 9 has been superseded by amendments brought in by the Wildlife and Natural Environment (Scotland) Act 2011 (WANE) where the legal presumption is now against causing the growth in the wild of any non-native species outwith their native range (exceptions and definitions apply to non-wild areas).

There was no **Japanese Knotweed** *(Fallopia japonica),* **Giant Hogweed** (*Heracleum mantegazzianum*) or **Himalayan Balsam** *(Impatiens glandulifera)* identified during this site inspection.

Survey Findings – Other Legislated Species

In addition to the commonly known plants noted above, there are other plants controlled under Schedule 9 of the Wildlife Countryside (Scotland) Act 1981 as amended by the Wildlife and Natural Environment (Scotland) Act 2011. Our reporting of these invasive plants is based on our opinion of the impact they will have on the proposed development and the risk that they will be spread as a result of the site works as the legislation controlling them make it an offence to grow or cause the growth of them.

Cotoneaster – Cotoneaster identified within the development area; refer to location plan and photographs.

CT1 – Cotoneaster was visible covering an area of approximately 40m². This shrub is dense and well established and under 0.5m tall.

CT2- Growing along and up wall, Cotoneaster was found measuring approximately 4m^2 and 2m tall.

CT3 – Covering an area of approximately 4m^2 Cotoneaster was identified growing along and up wall, found to be 1.5m tall, on grass verge.

CT4 – Visible Cotoneaster was identified covering an area of approximately 15m². This growth is dense and well established, among other shrubs.

Japanese Rose (Rosa Rugosa)- Japanese Rose identified within the development area; refer to location plan and photographs

JR1- Covering an area of approximately 200m², dense and well established Japanese Rose was identified within in survey area, found next to paved area and on grass.

JR2- Japanese Rose was identified among other shrubs and covers an area of approximately 10m². This growth is maintained and has recently been cut back.

Survey Findings – Problematic Non Legislated Species

In addition to the legislated plants recorded above, we also consider other non-legislated plants which could compromise/impact any development. While it is not an offence to have these plants on site there are reasons why the developer may want to consider management or treatment of them. One such plant is Horsetail.

There was no visible Horsetail recorded during our inspection of the survey area.

Why Manage Cotoneaster?

Damage To Infrastructure **-** In urban areas, this plant has the potential to cause damage to buildings and structures by rooting in crumbling mortar and cracks.

Legislation - Like Japanese Knotweed, this species is also controlled in Scotland under Schedule 9 of the Wildlife Countryside (Scotland) Act 1981 as amended by the Wildlife and Natural Environment (Scotland) Act 2011. This means that it is a criminal offence to encourage or cause the growth of this plant – this can include moving soils that contain the seeds of this plant. Soils containing the seeds or rhizomes (roots) of this species require to be managed under the current Waste Management Regulations.

Ecology - Cotoneaster is a persistent shrub which depending on species, can range in height from 1 - 3 metres in height. The dense growth of Cotoneaster quickly shades out our indigenous plants resulting in an adverse impact on our native ecology.

Ease of Spread – Cotoneaster spreads easily by seed dispersal and also regeneration of root fragments i.e. this species is also vegetative.

Why Manage Japanese Rose?

Legislation – Japanese Rose is also controlled in Scotland under Schedule 9 of the Wildlife Countryside (Scotland) Act 1981 as amended by the Wildlife and Natural Environment (Scotland) Act 2011. This means that it is a criminal offence to encourage or cause the growth of this plant – this can include moving soils that contain the seeds, corms or rhizome fragments depending on species. Soils containing plant material which is capable of regrowth requires to be managed under the current Waste Management Regulations.

Ecology - The dense growth of this non native species shades out our indigenous plants resulting in an adverse impact on our native ecology by reducing biodiversity and dominating amenity planting.

KleerKut Recommendations -

Commonly Known Species Controlled by Legislation –

There was no evidence of Japanese Knotweed, Himalayan Balsam or Giant Hogweed identified within this development.

Other Legislated Weeds –

While there was no Japanese Knotweed identified within the survey area, Cotoneaster and Japanese Rose shrubs were recorded which are controlled under the same legislation. We would recommend that the vegetation clearance is undertaken in a controlled manner at these locations to ensure that no further spread of these invasive shrubs result.

Should the client wish to use their own contractor to remove the vegetation, KleerKut could supervise the works, providing a site specific method of works which will ensure that no further spread of this invasive shrub results and that the vegetation clearance works are generally undertaken in accordance with current legislation.

Problematic Non-Legislated Weeds – There was no Horsetail identified within the survey area.

As noted, Horsetail was dying back for winter and leaves little residue, as it is early in the growing season there may be infestations present that were not visible at the time of our inspection.

In general, for the controlled invasive species we would recommend that an Invasive Weeds Management Plan/Management Strategy is put in place as soon as possible in order to manage risk and reduce the possibility of spread. The right solution for each development will vary from site to site and it is important to only consider solutions proposed by experienced Invasive Weeds Specialists. All works undertaken should ensure compliance with SEPA recommendations, current legislation and achieve Best Practice.

KleerKut Accreditation

KleerKut are a non-franchised Scottish business who have specialised in the management of invasive weeds since 2006. We have built up an enviable reputation as specialists in Japanese Knotweed by providing clear, concise and proven remediation strategies which ensure that Best Practical Environmental Options (BPEO) are achieved as recommended in the Japanese Knotweed Code of Practice.

Our knowledge and experience have enabled us to become approved consultants and contractors with many of the leading consultants, developers and construction companies throughout the UK. This was further enhanced after we were invited to join the Property Care Association (PCA). By being members of the PCA our works are Government endorsed through their Trustmark scheme.

KleerKut are accredited members of Constructionline and SMAS Safe Systems in Procurement demonstrating our commitment to working safely in partnership with our clients and sub contractors.

Thank you for your enquiry and should you have any further queries in relation to this site or any other site, please do not hesitate to contact me at this office.

Yours faithfully

Julie McLean

Summary

Has the search report highlighted evidence or potential of		
1	Past underground coal mining	No
2	Present underground coal mining	No
3	Future underground coal mining	Yes
4	Mine entries	No
5	Coal mining geology	No
6	Past opencast coal mining	No
7	Present opencast coal mining	No
8	Future opencast coal mining	No
9	Coal mining subsidence	No
10	Mine gas	No
11	Hazards related to coal mining	No
12	Withdrawal of support	No
13	Working facilities order	No
14	Payments to owners of former copyhold land	No

For detailed findings, please go to page 4.

Detailed findings

1. Past underground coal mining

The property is not within a surface area that could be affected by any past recorded underground coal mining.

2. Present underground coal mining

The property is not within a surface area that could be affected by present underground mining.

3. Future underground coal mining

The property is not in an area where the Coal Authority has received an application for, and is currently considering whether to grant a licence to remove or work coal by underground methods.

The property is not in an area where a licence has been granted to remove or otherwise work coal using underground methods.

The property is not in an area likely to be affected from any planned future underground coal mining.

However, reserves of coal exist in the local area which could be worked at some time in the future.

No notices have been given, under section 46 of the Coal Mining Subsidence Act 1991, stating that the land is at risk of subsidence.

4. Mine entries

There are no known coal mine entries within, or within 20 metres of, the boundary of the property.

5. Coal mining geology

The Coal Authority is not aware of any damage due to geological faults or other lines of weakness that have been affected by coal mining.

6. Past opencast coal mining

The property is not within the boundary of an opencast site from which coal has been removed by opencast methods.

7. Present opencast coal mining

The property does not lie within 200 metres of the boundary of an opencast site from which coal is being removed by opencast methods.

8. Future opencast coal mining

There are no licence requests outstanding to remove coal by opencast methods within 800 metres of the boundary.

The property is not within 800 metres of the boundary of an opencast site for which a licence to remove coal by opencast methods has been granted.

9. Coal mining subsidence

The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres of the enquiry boundary, since 31 October 1994.

There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The Coal Authority is not aware of any request having been made to carry out preventive works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991.

10. Mine gas

The Coal Authority has no record of a mine gas emission requiring action.

11. Hazards related to coal mining

The property has not been subject to remedial works, by or on behalf of the Coal Authority, under its Emergency Surface Hazard Call Out procedures.

12. Withdrawal of support

The property is not in an area where a notice to withdraw support has been given.

The property is not in an area where a notice has been given under section 41 of the Coal Industry Act 1994, cancelling the entitlement to withdraw support.

13. Working facilities order

The property is not in an area where an order has been made, under the provisions of the Mines (Working Facilities and Support) Acts 1923 and 1966 or any statutory modification or amendment thereof.

14. Payments to owners of former copyhold land

The property is not in an area where a relevant notice has been published under the Coal Industry Act 1975/Coal Industry Act 1994.

Additional remarks

Information provided by the Coal Authority in this report is compiled in response to the Law Society's CON29M Coal Mining enquiries. The said enquiries are protected by copyright owned by the Law Society of 113 Chancery Lane, London WC2A 1PL. This report is prepared in accordance with the Law Society's Guidance Notes 2018, the User Guide 2018 and the Coal Authority's Terms and Conditions applicable at the time the report was produced.

Test Methods

SOP	Title	Parameters included	Method summary
1220	Anions, Alkalinity & Ammonium in Waters	Fluoride; Chloride; Nitrite; Nitrate; Total; Oxidisable Nitrogen (TON); Sulfate; Phosphate; Alkalinity; Ammonium	Automated colorimetric analysis using 'Aquakem 600' Discrete Analyser.
1325	Sulphide in Waters	Sulphides	Automated colorimetric analysis by 'Aquakem 600' Discrete Analyser using N,N–dimethyl-pphenylenediamine.
1415	Cations in Waters by ICP-MS	Sodium; Potassium; Calcium; Magnesium	Direct determination by inductively coupled plasma - mass spectrometry (ICP-MS).
1450	Metals in Waters by ICP-MS	Metals, including: Antimony; Arsenic; Barium; Beryllium; Boron; Cadmium; Chromium; Cobalt; Copper; Lead; Manganese; Mercury; Molybdenum; Nickel; Selenium; Tin; Vanadium; Zinc	Filtration of samples followed by direct determination by inductively coupled plasma mass spectrometry (ICP-MS).
1460	Mercury low-level in Waters by AFS	Mercury	Atomic Fluorescence Spectrometry, with collimated UV source, wavelength 253.7 nm.
1920	Phenols in Waters by HPLC	Phenolic compounds including: Phenol, Cresols, Xylenols, Trimethylphenols Note: Chlorophenols are excluded.	Determination by High Performance Liquid Chromatography (HPLC) using electrochemical detection.
2010	pH Value of Soils	pH	pH Meter
2020	Electrical Conductivity	Electrical conductivity (EC) of aqueous extract or calcium sulphate solution for topsoil	Measurement of the electrical resistance of a 2:1 water/soil extract.
2030	Moisture and Stone Content of Soils(Requirement of MCERTS)	Moisture content	Determination of moisture content of soil as a percentage of its as received mass obtained at <37°C.
2040	Soil Description(Requirement of MCERTS)	Soil description	As received soil is described based upon BS5930
2120	Water Soluble Boron, Sulphate, Magnesium & Chromium	Boron; Sulphate; Magnesium; Chromium	Aqueous extraction / ICP-OES
2150	Redox Potential	Redox Potential	Meter
2192	Asbestos	Asbestos	Polarised light microscopy / Gravimetry
2300	Cyanides & Thiocyanate in Soils	Free (or easy liberatable) Cyanide; total Cyanide; complex Cyanide; Thiocyanate	Allkaline extraction followed by colorimetric determination using Automated Flow Injection Analyser.
2325	Sulphide in Soils	Sulphide	Steam distillation with sulphuric acid / analysis by 'Aquakem 600' Discrete Analyser, using N,N–dimethyl-p-phenylenediamine.
2430	Total Sulphate in soils	Total Sulphate	Acid digestion followed by determination of sulphate in extract by ICP-OES.
2450	Acid Soluble Metals in Soils	Metals, including: Arsenic; Barium; Beryllium; Cadmium; Chromium; Cobalt; Copper; Lead; Manganese; Mercury; Molybdenum; Nickel; Selenium; Vanadium; Zinc	Acid digestion followed by determination of metals in extract by ICP-MS.
2490	Hexavalent Chromium in Soils	Chromium [VI]	Soil extracts are prepared by extracting dried and ground soil samples into boiling water. Chromium [VI] is determined by 'Aquakem 600' Discrete Analyser using 1,5-diphenylcarbazide.
2625	Total Organic Carbon in Soils	Total organic Carbon (TOC)	Determined by high temperature combustion under oxygen, using an Eltra elemental analyser.
2680	TPH A/A Split	Aliphatics: >C5–C6, >C6–C8,>C8–C10, >C10–C12, >C12–C16, >C16–C21, >C21–C35, >C35– C44Aromatics: >C5–C7, >C7–C8, >C8– C10, >C10–C12, >C12–C16, >C16– C21, >C21– C35, >C35– C44	Dichloromethane extraction / GCxGC FID detection

Test Methods

SOP	Title	Parameters included	Method summary
2700	Speciated Polynuclear Aromatic Hydrocarbons (PAH) in Soil by GC-FID	Acenaphthene; Acenaphthylene; Anthracene; Benzo[a]Anthracene; Benzo[a]Pyrene; Benzo[b]Fluoranthene; Benzo[ghi]Perylene; Benzo[k]Fluoranthene; Chrysene; Dibenz[ah]Anthracene; Fluoranthene; Fluorene; Indeno[123cd]Pyrene; Naphthalene; Phenanthrene; Pyrene	Dichloromethane extraction / GC-FID (GC-FID detection is non-selective and can be subject to interference from co-eluting compounds)
2760	Volatile Organic Compounds (VOCs) in Soils by Headspace GC-MS	Volatile organic compounds, including BTEX and halogenated Aliphatic/Aromatics.(cf. USEPA Method 8260)*please refer to UKAS schedule	Automated headspace gas chromatographic (GC) analysis of a soil sample, as received, with mass spectrometric (MS) detection of volatile organic compounds.
2790	Semi-Volatile Organic Compounds (SVOCs) in Soils by GC-MS	Semi-volatile organic compounds(cf. USEPA Method 8270)	Acetone/Hexane extraction / GC-MS
2920	Phenols in Soils by HPLC	Phenolic compounds including Resorcinol, Phenol, Methylphenols, Dimethylphenols, 1-Naphthol and TrimethylphenolsNote: chlorophenols are excluded.	60:40 methanol/water mixture extraction, followed by HPLC determination using electrochemical detection.
640	Characterisation of Waste (Leaching)	Waste material including soil, sludges and granular waste	ComplianceTest for Leaching of Granular Waste Material and Sludge

Report Information

Key

U	UKAS accredited
M	MCERTS and UKAS accredited
N	Unaccredited
S	This analysis has been subcontracted to a UKAS accredited laboratory that is accredited for this analysis
SN	This analysis has been subcontracted to a UKAS accredited laboratory that is not accredited for this analysis
T	This analysis has been subcontracted to an unaccredited laboratory
I/S	Insufficient Sample
U/S	Unsuitable Sample
N/E	not evaluated
<	"less than"
>	"greater than"

Comments or interpretations are beyond the scope of UKAS accreditation
The results relate only to the items tested
Uncertainty of measurement for the determinands tested are available upon request
None of the results in this report have been recovery corrected
All results are expressed on a dry weight basis
The following tests were analysed on samples as received and the results subsequently corrected to a dry weight basis TPH, BTEX, VOCs, SVOCs, PCBs, Phenols
For all other tests the samples were dried at < 37°C prior to analysis
All Asbestos testing is performed at the indicated laboratory
Issue numbers are sequential starting with 1 all subsequent reports are incremented by 1

Sample Deviation Codes

A - Date of sampling not supplied
B - Sample age exceeds stability time (sampling to extraction)
C - Sample not received in appropriate containers
D - Broken Container
E - Insufficient Sample (Applies to LOI in Trommel Fines Only)

Sample Retention and Disposal

All soil samples will be retained for a period of 45 days from the date of receipt
All water samples will be retained for 14 days from the date of receipt
Charges may apply to extended sample storage

If you require extended retention of samples, please email your requirements to:
customerservices@chemtest.com

Supplementary Hazardous Property Information

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"

Force this Hazardous property to non hazardous because No free phase hydrocarbons identified onsite

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.013%)

Classification of sample: TP11

Hazardous Waste

Hazardous Waste
Classified as **17 05 03 ***
in the List of Waste

Sample details

Sample Name:
TP12
Sample Depth:
0.8 m
Moisture content:
16%
(no correction)

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 03 * (Soil and stones containing hazardous substances)

Hazard properties

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"
Force this Hazardous property to hazardous because No free phase hydrocarbons identified onsite

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.06%)

Supplementary Hazardous Property Information

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"

Force this Hazardous property to non hazardous because No free phase hydrocarbons identified onsite

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.0089%)

Classification of sample: TP17

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Sample details

Sample Name:
TP17
Sample Depth:
0.30 m
Moisture content:
13%
(no correction)

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 04 (Soil and stones other than those mentioned in 17 05 03)

Hazard properties

None identified

Classification of sample: BH03

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Sample details

Sample Name:
BH03
Sample Depth:
0.50 m
Moisture content:
7.1%
(no correction)

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 04 (Soil and stones other than those mentioned in 17 05 03)

Hazard properties

None identified

Determinands

Moisture content: 7.1% No Moisture Correction applied (MC)

Supplementary Hazardous Property Information

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"

Force this Hazardous property to non hazardous because No free phase hydrocarbons identified onsite

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.012%)

Classification of sample: BH09

Hazardous Waste
Classified as **17 05 03 ***
in the List of Waste

Sample details

Sample Name:
BH09
Sample Depth:
0.50 m
Moisture content:
9.2%
(no correction)

LoW Code:
Chapter: 17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Entry: 17 05 03 * (Soil and stones containing hazardous substances)

Hazard properties

HP 7: Carcinogenic "waste which induces cancer or increases its incidence"

Hazard Statements hit:

Carc. 1B; H350 "May cause cancer [state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard]."

Because of determinand:

lead chromate: (Note 1 conc.: 0.21%)

HP 14: Ecotoxic "waste which presents or may present immediate or delayed risks for one or more sectors of the environment"

Hazard Statements hit:

Aquatic Chronic 1; H410 "Very toxic to aquatic life with long lasting effects."

Because of determinands:

copper sulphate pentahydrate: (compound conc.: 0.145%)
lead chromate: (Note 1 conc.: 0.21%)

Determinands

Hazardous Waste
Classified as **17 05 03 ***
in the List of Waste

Sample details

Sample Name:	LoW Code:	
BH13[2]	Chapter:	17: Construction and Demolition Wastes (including excavated soil from contaminated sites)
Sample Depth:		
1.00 m	Entry:	17 05 03 * (Soil and stones containing hazardous substances)
Moisture content:		
13% (no correction)		

Hazard properties

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"

Force this Hazardous property to hazardous because No free phase hydrocarbons identified onsite

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.027%)

HP 7: Carcinogenic "waste which induces cancer or increases its incidence"

Hazard Statements hit:

Carc. 1A; H350 "May cause cancer [state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard]."

Because of determinand:

arsenic pentoxide: (compound conc.: 0.23%)

Carc. 1B; H350 "May cause cancer [state route of exposure if it is conclusively proven that no other routes of exposure cause the hazard]."

Because of determinand:

lead chromate: (Note 1 conc.: 1.3%)

HP 10: Toxic for reproduction "waste which has adverse effects on sexual function and fertility in adult males and females, as well as developmental toxicity in the offspring"

Hazard Statements hit:

Repr. 1A; H360Df "May damage the unborn child. Suspected of damaging fertility."

Because of determinand:

lead chromate: (Note 1 conc.: 1.3%)

HP 14: Ecotoxic "waste which presents or may present immediate or delayed risks for one or more sectors of the environment"

Hazard Statements hit:

Aquatic Chronic 1; H410 "Very toxic to aquatic life with long lasting effects."

Because of determinands:

arsenic pentoxide: (compound conc.: 0.23%)
copper sulphate pentahydrate: (compound conc.: 1.022%)
lead chromate: (Note 1 conc.: 1.3%)
zinc oxide: (compound conc.: 0.137%)

Supplementary Hazardous Property Information

HP 3(i): Flammable "flammable liquid waste: liquid waste having a flash point below 60°C or waste gas oil, diesel and light heating oils having a flash point > 55°C and <= 75°C"

Force this Hazardous property to non hazardous because No free phase hydrocarbons identified onsite

Hazard Statements hit:

Flam. Liq. 3; H226 "Flammable liquid and vapour."

Because of determinand:

TPH (C6 to C40) petroleum group: (conc.: 0.0086%)

Classification of sample: TP05[3]

Non Hazardous Waste
Classified as **17 05 04**
in the List of Waste

Key

	User supplied data
	Determinand values ignored for classification, see column 'Conc. Not Used' for reason
	Determinand defined or amended by HazWasteOnline (see Appendix A)
	Speciated Deteminand - Unless the Determinand is Note 1, the Conversion Factor is used to calculate the compound concentration
<LOD	Below limit of detection
CLP: Note 1	Only the metal concentration has been used for classification
CLP: Note H	Known incomplete entry, should not be used as is

Appendix A: Classifier defined and non CLP determinands

pH (CAS Number: PH)

Description/Comments: Appendix C4
Data source: WM3 1st Edition 2015
Data source date: 25 May 2015
Hazard Statements: None.

salts of hydrogen cyanide with the exception of complex cyanides such as ferrocyanides, ferricyanides and mercuric oxycyanide and those specified elsewhere in this Annex

CLP index number: 006-007-00-5
Description/Comments: Conversion factor based on a worst case compound: sodium cyanide
Data source: Commission Regulation (EC) No 790/2009 - 1st Adaptation to Technical Progress for Regulation (EC) No 1272/2008. (ATP1)
Additional Hazard Statement(s): EUH032 >= 0.2 %
Reason for additional Hazards Statement(s)/Risk Phrase(s):
14 Dec 2015 - EUH032 >= 0.2 % hazard statement sourced from: WM3, Table C12.2

chromium(III) oxide (EC Number: 215-160-9, CAS Number: 1308-38-9)

Conversion factor: 1.462
Description/Comments: Data from C&L Inventory Database
Data source: http://echa.europa.eu/web/guest/information-on-chemicals/cl-inventory-database
Data source date: 17 Jul 2015

Appendix B: Rationale for selection of metal species

boron {boron tribromide}

Worst Case Selected

cyanides {salts of hydrogen cyanide with the exception of complex cyanides such as ferrocyanides, ferricyanides and mercuric oxycyanide and those specified elsewhere in this Annex}

Worst Case Selected

arsenic {arsenic pentoxide}

Worst case species

cadmium {cadmium sulfate}

Assumed worst case based on likely contaminants

chromium in chromium(III) compounds {chromium(III) oxide}

Worst case species

copper {copper sulphate pentahydrate}

Assumed worst case based on expected contaminants

mercury {mercury dichloride}

Assumed likely form of mercury compound

nickel {nickel sulfide}

Assumed likely form of contaminant

lead {lead chromate}

Worst case species

selenium {selenium}

Worst case species

zinc {zinc oxide}

Worst case species

chromium in chromium(VI) compounds {chromium(VI) oxide}

Worst case species

Appendix C: Version

HazWasteOnline Classification Engine: WM3 1st Edition v1.1, May 2018
HazWasteOnline Classification Engine Version: 2019.152.3882.7895 (01 Jun 2019)
HazWasteOnline Database: 2019.152.3882.7895 (01 Jun 2019)

This classification utilises the following guidance and legislation:
WM3 v1.1 - Waste Classification - 1st Edition v1.1 - May 2018
CLP Regulation - Regulation 1272/2008/EC of 16 December 2008
1st ATP - Regulation 790/2009/EC of 10 August 2009
2nd ATP - Regulation 286/2011/EC of 10 March 2011
3rd ATP - Regulation 618/2012/EU of 10 July 2012
4th ATP - Regulation 487/2013/EU of 8 May 2013
Correction to 1st ATP - Regulation 758/2013/EU of 7 August 2013
5th ATP - Regulation 944/2013/EU of 2 October 2013
6th ATP - Regulation 605/2014/EU of 5 June 2014
WFD Annex III replacement - Regulation 1357/2014/EU of 18 December 2014
Revised List of Wastes 2014 - Decision 2014/955/EU of 18 December 2014
7th ATP - Regulation 2015/1221/EU of 24 July 2015
8th ATP - Regulation (EU) 2016/918 of 19 May 2016
9th ATP - Regulation (EU) 2016/1179 of 19 July 2016
10th ATP - Regulation (EU) 2017/776 of 4 May 2017
HP14 amendment - Regulation (EU) 2017/997 of 8 June 2017
13th ATP - Regulation (EU) 2018/1480 of 4 October 2018
POPs Regulation 2004 - Regulation 850/2004/EC of 29 April 2004
1st ATP to POPs Regulation - Regulation 756/2010/EU of 24 August 2010
2nd ATP to POPs Regulation - Regulation 757/2010/EU of 24 August 2010

Dear Sirs,

LABORATORY TESTING OF SOIL

Introduction

We refer to samples taken from Beach Drive, Irvine and delivered to our laboratory on 18th March 2019.

Material & Source

Sample Reference	:	See Report Plates
Sampled By	:	Client
Sampling Certificate	:	Not Supplied
Location	:	See Report Plates
Description	:	See Page 2
Date Sampled	:	Not Supplied
Date Tested	:	18th March 2019 Onwards
Source	:	Beach Drive, Irvine

Test Results;

As Detailed On Page 2 to Page 10 inclusive

Comments;

Opinions and interpretations expressed herein are outside the scope of UKAS accreditation
This report should not be reproduced except in full without the written approval of the laboratory
All remaining samples for this project will be disposed of 28 days after issue of this test certificate

Remarks;

Approved for Issue

T McLelland (Director)

Date 25/03/2019

2643

BOREHOLE	SAMPLE	DEPTH (m)	SAMPLE DESCRIPTION
BH01	U	1.00-1.90	Brown fine to coarse SAND.
BH02	U(B)	2.00-3.00	Brown slightly gravelly fine to coarse SAND. Gravel is fine to medium.
BH04	U(B)	3.00-4.00	Brown slightly gravelly fine to coarse SAND. Gravel is fine to medium.
BH05	U(B)	1.00-2.00	Brown slightly gravelly fine to coarse SAND with pockets of clay. Gravel is fine to medium.
BH07	U(B)	2.00-3.00	Brown slightly gravelly fine to coarse SAND with pockets of clay. Gravel is fine to medium.
BH10	U(B)	3.00-4.00	Brown gravelly fine to coarse SAND. Gravel is fine to coarse.
BH11	U(B)	2.00-3.00	Brown gravelly fine to coarse SAND. Gravel is fine to coarse.
BH12	U(B)	1.00-2.00	Mottled brown fine to coarse SAND and GRAVEL.

CLAY	SILT ₸	SAND	GRAVEL	COBBLES
/	3	81	16	0

D10	D60	Specification
-	-	
UNIFORMITY COEFFICIENT	-	-

Remarks

₸ Where a sedimentation test was not carried out, this figure represents total fines, i.e., particles of diameter less than 63 microns
